NO-07 Dispersed polities: the Icelandic Commonwealth and the Hanse

The preservation of complex human coordination following the permanent loss of industrial supply chains and central state authority represents a profound challenge in institutional design. When the vertical hierarchy of a sovereign executive collapses, societies must engineer lateral mechanisms to enforce contracts, resolve disputes, and allocate resources. Dispersed polities—arrangements in which authority is distributed among autonomous agents without a central coercive center—provide historical laboratories for such mechanics. This report examines three historical models of dispersed governance: the Icelandic Commonwealth (930–1262), the Hanseatic League (c. 1356–1669), and the extreme maritime mobility of the Southeast Asian Sea Nomads (principally the Sama-Bajau, Moken, and Orang Laut). By interrogating these arrangements, the analysis seeks to identify how stateless systems function, how they scale, and how they inevitably succumb to the gravitational pull of territorial states or capture by individuals exhibiting dark-triad traits (narcissism, Machiavellianism, psychopathy).

Arrangement I: The Icelandic Commonwealth (930–1262)

The Icelandic Commonwealth emerged from the migration of Norse settlers between 870 and 930, fleeing the centralizing ambitions of King Harald Fairhair of Norway[1]. Upon claiming the uninhabited island, these settlers, beginning with figures like Ingólfr Arnarson in 874, engineered a society entirely devoid of a central executive, relying instead on a highly sophisticated, privately enforced legal system[1]. The population of Iceland during this period remained relatively stable, estimated at between 40,000 and 80,000 individuals[2].

Structural Mechanics and Private Enforcement

The foundational unit of Icelandic governance above the household was the *goðorð* (plural: *goðorð*), a chieftaincy held by a *goði* (plural: *goðar*)[1]. Unlike feudal European structures, the *goðorð* was not a strictly territorial domain but a transferable social contract. A free farmer (*bóndi*) was required to pledge allegiance to a *goði*, but was legally permitted to switch this allegiance to any other chieftain within his geographical quarter if his current patron failed to provide adequate legal protection[3]. The Commonwealth initially featured 39 *goðorð*, which later expanded to 48 as the island was divided into quarters to manage regional courts[4].

The legislative and judicial center of this dispersed polity was the Althing, an annual assembly where the *goðar* and their followers convened[3]. The sole public official was the Lawspeaker (*lögsögumaður*), elected for a three-year term. The Lawspeaker possessed no executive power; his only duty was to memorize, recite, and interpret the law code, known as *Grágás* (Grey Goose), which was finally codified in writing around 1117[1]. *Grágás* was a profoundly complex legal architecture characterized by extreme quantification. For example, it detailed 19 distinct, ranked classes of kin for the purposes of inheritance and the distribution of wergild

(blood-money)[7]. If a man died, the law strictly dictated that his legitimate son inherited; if no son existed, the daughter; if no daughter, the father; and so forth down through illegitimate children and distant cousins, ensuring wealth transfer was predictable and tightly bound to bilateral kinship networks[7].

Enforcement in this stateless society was entirely privatized. If a Quarter Court or the appellate Fifth Court (established circa 1005 by Skapti the Lawspeaker) ruled in favor of a plaintiff, the court provided no police force to extract the penalty[4]. It was the plaintiff's responsibility to enforce the judgment, often by organizing a posse of allies or by transferring the legal claim to a more powerful *goði* in exchange for a percentage of the compensation[8]. Modern economic historians, notably David Friedman in his 1979 analysis, have lauded this system as a highly functional market for justice, where the transferability of tort claims allowed weaker individuals to seek redress through powerful, competing brokers[3].

Parallel to the *goðorð* was the *hreppur* (plural: *hreppar*), a compulsory localized commune consisting of a minimum of twenty property-owning farmers[4]. The *hreppur* functioned as a geographical administrative unit dedicated to mutual insurance and poor relief[11]. If a farmer's house burned down or his livestock died of disease, the *hreppur* absorbed a calculated percentage of the loss, ensuring localized stability. Furthermore, the *hreppur* managed the *afréttir* (communal highland pastures), dictating the strict timing of summer sheep grazing and enforcing exclusion rights against non-members to prevent the tragedy of the commons[10].

The Three Perspectives: Claims, Records, and Inferences

What the arrangement's own people said it did: The authors of the 13th-century Icelandic sagas characterized their system as an honor-driven framework where free men maintained a delicate equilibrium through the mechanism of the feud. In their view, the law was a sacred inheritance. Violence was not anarchic; it was a highly structured, almost theatrical performance necessary to maintain one's social standing and compel adversaries to accept arbitration[9].

What the record shows it did: The historical and archaeological records demonstrate that the system facilitated over two centuries of relatively stable expansion and agricultural management before collapsing into a catastrophic civil war known as the Age of the Sturlungs (1220–1262)[1]. The record shows that the system was exceptionally bloody during its breakdown. The Battle of Haugsnes, fought on April 19, 1246, between the Sturlungar and Ásbirningar clans, stands as the deadliest battle in Icelandic history. Out of approximately 1,100 combatants, roughly 110 were killed—a 10% casualty rate that was devastating for a low-population society[14].

What modern scholarship infers: Modern scholarship infers that the Commonwealth's initial stability was a demographic artifact of an open frontier. Once arable land became scarce, the egalitarian veneer dissolved. William Ian Miller, in *Bloodtaking and Peacemaking* (1990), infers that the feud operated as a precise legal instrument of social control, complete with its own economy of injury and compensation[9]. Conversely, Jesse Byock (1982, 2001) argues that the sagas reveal a society obsessed with arbitration and consensus, where violence was a failure of the system rather than its central engine[5].

The Strongest Case Against the Commonwealth Model

The most formidable critique of the Commonwealth's romanticized statelessness comes from historian Helgi Thorlaksson (2001) and Jón Viðar Sigurðsson. Thorlaksson vehemently disputes Miller and Byock's framing of the system as an egalitarian network of independent farmers. He argues that the Commonwealth was, in reality, a steeply hierarchical oligarchy defined by extreme inequality and unfree labor, including slavery (*thralls*)[12]. According to Thorlaksson, the capacity of free farmers to switch their allegiance between *goðar* was largely a legal fiction by the twelfth century. In practice, chieftains utilized extortion, regional monopolies, and the threat of overwhelming violence to force local populations into subjugation. The absence of a state did not mean the presence of liberty; it meant the privatization of coercion by an entrenched, wealthy elite who operated as localized warlords[12].

Scale Ledger: Icelandic Commonwealth	Functional Status	Causes of Success or Failure
Household (4–10)	**Worked**	Deeply codified inheritance laws (*Grágás*); strict patriarchal authority over dependents and slaves[7].
Hamlet/Band (30–50)	**Worked**	Regulated by the *hreppur* (commune) system, providing mandatory mutual insurance and poor relief[10].
Village (150–500)	**Worked**	Governed by the personal networks of the *goðorð*, bound by oaths, feasts, and reciprocal gift-giving[3].
District (1,500–5,000)	**Worked**	Managed by Quarter Courts at regional assemblies, enforcing wergild and sentences of outlawry[4].
Town (15k–50k)	**Never Tried**	Iceland lacked the agricultural surplus and timber required to support concentrated urban

		centers.
Region (0.5M–5M)	**Failed**	When the population approached ecological carrying capacity, capital accumulated into a destructive oligarchy[2].
Nation/Continent	**Failed**	System surrendered to the Norwegian Crown in 1262 via the Old Covenant[1].
Planet (8 Billion)	**Never Tried**	N/A

Capture Test: The Tithe and the Sturlung Oligarchy

The vulnerability of the Icelandic Commonwealth to capture by actors exhibiting dark-triad traits (specifically Machiavellianism and psychopathy) was structural. The turning point was the introduction of the Tithe Law in 1096[5]. The tithe required a 1% annual wealth tax on property, intended by the Church to be divided into four equal parts: the bishop, the church building, the priest, and the poor[5].

However, a dark-triad *goði* quickly recognized a massive loophole. Chieftains owned the land upon which the local churches (*staðir*) were built. Through property rights, they claimed ownership of the church itself and often took minor religious orders to serve as the local priest. Consequently, the chieftain legally absorbed 50% of the public tax revenue (the church's share and the priest's share)[6]. This generated a massive, unidirectional flow of capital to the elite.

By the 13th century, this capital allowed ambitious chieftains to purchase rival *goðorð*. The 39 independent chieftaincies were violently consolidated into the hands of just six major families, most notably the Sturlungar, Haukdælir, and Ásbirningar[13]. The Age of the Sturlungs was characterized by psychopathic violence, betrayal, and the explicit pursuit of absolute dominion.

Gissur Thorvaldsson of the Haukdælir clan exemplifies this dark-triad capture. Demonstrating ruthless Machiavellianism, Gissur led seventy men to the estate of Reykholt in the autumn of 1241 and assassinated his former father-in-law, the great historian and chieftain Snorri Sturluson, who was caught hiding in a cellar and struck down by assassins Árni the Bitter and Símon knútur[18].

Gissur's faction continued its campaign of terror, culminating in the horrific Flugumýri Arson on October 22, 1253, where rivals burned Gissur's estate during a wedding celebration, incinerating 25 people, including his wife and three sons, though Gissur himself narrowly escaped[15]. Ultimately, the Commonwealth could not reverse this elite capture. To escape the endemic warlordism, the exhausted population agreed to submit to King Haakon IV of Norway through the Old Covenant (1262–1264), extinguishing the dispersed polity and importing the centralized Norwegian law code, *Jónsbók*, in 1281[1].

Arrangement II: The Hanseatic League (c. 1356–1669)

While Iceland attempted dispersed governance in an agrarian periphery, the Hanseatic League (the Hansa) enacted it across the commercial arteries of Northern Europe. Emerging formally around 1356 with the first general assembly, the Hansa was a transnational federation encompassing between 70 and 200 towns, stretching from the Netherlands to Russia, and reaching as far south as Kraków[20]. Remarkably, this entity dominated Baltic and North Sea trade for three centuries without a capital city, a central treasury, a standing army, or a shared foundational charter[22].

Structural Mechanics and Economic Coordination

The Hansa was simultaneously a network of individual merchants (Kaufmannshanse) and a network of cities (Städtehanse)[22]. Its primary deliberative body was the *Hansetag* (Hanseatic Diet), an irregular assembly hosted usually in Lübeck. Here, city representatives engaged in marathon negotiations—sometimes lasting over a week—to synchronize tariffs, standardize weights and measures, and resolve internal disputes[23].

The operational hubs of the Hansa were the *Kontore* (foreign trading posts), the most prominent being the Steelyard in London, the Bryggen in Bergen, the Peterhof in Novgorod, and the Kontor in Bruges[23]. These enclaves were heavily fortified and governed by draconian internal rules designed to prevent the leakage of trade secrets and capital. In the Bergen Bryggen, which housed up to 1,000 German merchants across 90 rooms, strict celibacy was enforced, and fraternization with the local Norwegian population of 10,000 was strictly prohibited[25].

Lacking a standing military, the Hansa enforced its will through economic coercion, specifically the *Verhansung* (embargo)[27]. If a foreign monarch abused Hanseatic merchants, or if a member city broke guild rules, the League would sever all trade. This tactic proved devastating in a pre-industrial world dependent on the Hansa for grain, timber, wax, and the immensely lucrative Baltic herring[21]. To spread the immense financial risk of maritime trade, the Hansa developed fractional ship ownership, with single vessels divided among 2, 4, or eventually 64 shareholders[23].

The Three Perspectives: Claims, Records, and Inferences

What the arrangement's own people said it did: Hanseatic merchants claimed their organization was a defensive pact required to protect honest traders from piratical nobles, arbitrary taxation, and the physical perils of medieval seafaring. They framed their monopolies as a necessary mechanism to guarantee the quality of goods, standardize navigation (including building 15 lighthouses by 1600), and ensure the safety of the seas[21].

What the record shows it did: The historical record shows the Hansa operated as a sovereign-level geopolitical actor capable of toppling monarchs. During the Danish-Hanseatic War (1361–1370), sparked when King Valdemar IV Atterdag conquered Visby, the League funded a mercenary fleet, blockaded Copenhagen, and forced Valdemar to sign the Treaty of Stralsund on May 24, 1370[30]. The treaty granted the Hansa a total monopoly on the Baltic fish trade, widespread tax exemptions, and, astoundingly, veto power over future Danish throne

candidates, marking the zenith of Hanseatic power[29].

What modern scholarship infers: Modern scholarship is deeply divided on the economic impact of the Hansa. Avner Greif, Paul Milgrom, and Barry Weingast (1994) infer that the merchant guild solved the fundamental game-theoretic problem of sovereign commitment. Because an individual merchant could not punish a heavily armed foreign king, bilateral reputation failed. The Hansa utilized a "multilateral reputation mechanism." If a ruler confiscated one merchant's goods, the entire League instituted an embargo, thereby making trade safe and expanding the medieval economy[32].

The Strongest Case Against the Hanseatic Model

The most devastating critique of the Greif-Milgrom-Weingast (GMW) hypothesis is delivered by Sheilagh Ogilvie in *Institutions and European Trade: Merchant Guilds, 1000–1800* (2011). Ogilvie marshals vast archival evidence to argue that the Hansa was not an efficiency-enhancing institution, but a destructive, rent-seeking cartel[35].

Ogilvie points out that the GMW model assumes boycotts were used to enforce fair play against abusive rulers. In reality, the Hansa used the *Verhansung* to violently suppress independent competitors, crush rural artisans, and extort absolute monopolies from local rulers[35]. The Hansa artificially restricted the volume of trade to keep sale prices high for consumers and purchase prices low for producers (monopsony). Ogilvie argues that the "social capital" of the Hansa was highly localized to its patrician members and generated massive negative externalities for the broader European economy, intentionally stunting technological innovation, limiting work hours, and hoarding wealth within an exclusionary elite[36].

Scale Ledger: Hanseatic League	Functional Status	Causes of Success or Failure
Household (4–10)	**Never Tried**	The Hansa was a macro-economic alliance of urban elites, not a domestic governance structure.
Hamlet/Band (30–50)	**Never Tried**	Irrelevant to urban mercantile operations.
Village (150–500)	**Failed**	The Hansa explicitly targeted and crushed rural village artisans to maintain urban manufacturing monopolies[38].
District (1,500–5,000)	**Worked**	Managed localized trade

		enclaves like the *Kontore*, utilizing strict internal policing and celibacy[23].
Town (15k–50k)	**Worked**	Dominated city councils (Lübeck, Danzig, Cologne) via merchant patriciate rule, suppressing craft guilds[23].
Region (0.5M–5M)	**Worked**	Coordinated vast logistics networks across the Baltic and North Seas via the *Hansetag*[21].
Nation/Continent	**Failed**	Unable to survive the rise of the centralized territorial nation-state and mercantilist standing armies[41].
Planet (8 Billion)	**Never Tried**	N/A

Capture Test: Patrician Oligarchy and the Peace of Westphalia

Internally, the Hanseatic League was highly susceptible to capture by dark-triad personalities within the merchant elite. Machiavellian merchant families routinely captured local town councils, transforming democratic or republican municipal structures into hereditary oligarchies. They weaponized the *Verhansung* not just against foreign kings, but against domestic political rivals and poorer craft guilds, starving out any opposition that threatened their monopoly rents[23].

Externally, the Hansa was ultimately captured and dismantled by the evolution of the very entity it sought to bypass: the territorial state. By the 16th and 17th centuries, monarchs in England, Russia, and Scandinavia developed standing armies and sovereign taxation systems. They no longer needed the Hanseatic cartel for credit or logistics and began revoking their privileges[41]. The definitive end was signaled by the Peace of Westphalia in October 1648, which concluded the Thirty Years' War[42]. Westphalia enshrined the concept of absolute, inviolable state sovereignty over a defined territory[42]. A dispersed, transnational, non-state actor like the Hansa became a legal and geopolitical impossibility in a Westphalian world. By the final *Hansetag* in 1669, the League had lost its power, and only nine cities bothered to attend[20].

Arrangement III: The Mobile Extreme — Sea Nomads

At the absolute extreme of dispersed governance are the maritime nomads of Southeast Asia, primarily the Sama-Bajau (Philippines, Malaysia, Indonesia), the Moken (Mergui Archipelago of

Myanmar and Thailand), and the Orang Laut (Strait of Malacca)[46]. Numbering from approximately 2,000 (Moken) to over one million (Sama-Bajau), these groups traditionally lived entirely on the water in small houseboats[46].

Structural Mechanics and Evasion

The basic unit of governance is the boat (*kabang* for the Moken, *lepa* for the Bajau), typically housing a nuclear family of five to six individuals alongside simple seafood-gathering tools[51]. These boats coalesce into temporary flotillas or bands of 30 to 50 people, bound by bilateral kinship[51]. Leadership is highly informal; an elder or headman, holding titles such as *Panglima*, exercises influence solely through charisma, navigational skill, and consensus, lacking any coercive authority or formal penal system[56].

The primary mechanism of coordination and defense for sea nomads is *fission* and *flight*. When disputes arise internally, or when external threats materialize from territorial states, the flotilla simply unties its moorings and disperses into the sprawling archipelagos[49]. Anthropologist Jacques Ivanoff (1999) emphasizes that the boat is not just a transport tool, but "symbolic technology"—the physical embodiment of their social independence and spiritual identity; without it, they cease to be nomads[52].

This intense evolutionary pressure has even produced biological divergence. A 2018 study published in *Cell* by Melissa Ilardo et al. discovered that the Bajau possess a genetic adaptation in the PDE10A gene. Natural selection for extreme breath-hold diving has provided them with spleens up to 50% larger than neighboring land populations, serving as a massive reservoir for oxygenated red blood cells[60].

The Three Perspectives: Claims, Records, and Inferences

What the arrangement's own people said it did: The sea nomads frame their existence as a harmonious integration with the ocean, prioritizing immediate returns, autonomy, and the outright rejection of material accumulation. They view wealth hoarding as a physical burden that slows the boat and a moral failing that contradicts their communal spirit[53].

What the record shows it did: To avoid the romance of the primitive and the naturalistic fallacy, it must be noted that these groups were not isolated, peaceful primitives, but vital cogs in the violent pre-colonial global economy. Leonard Andaya (2008) demonstrates that the Orang Laut operated as the official, heavily armed naval force for the maritime empires of Srivijaya (7th century) and Malacca (15th century)[48]. They ruthlessly patrolled the straits, forced foreign merchants into their patron's ports, and engaged in state-sanctioned piracy and slave-raiding. In return, Malaccan rulers granted Orang Laut leaders elite noble titles (*mandarins*) and integrated them into the royal court through bilateral kinship and milk-brotherhood[63].

What modern scholarship infers: Scholars infer that "sea nomadism" is a highly adaptive, specialized economic strategy rather than a static relic of the Stone Age. Clifford Sather (1997) infers that sea nomads actively chose this lifestyle to exploit specific, patchy ecological niches (gathering trepang, pearls, and tortoiseshell) for trade with land-based states, exchanging marine luxuries for carbohydrates, iron, and cloth[51].

Scale Ledger: Sea Nomads	Functional Status	Causes of Success or Failure
Household (4–10)	**Worked**	Perfect alignment of survival, labor, and mobility within the boat (*kabang*/*lepa*)[51].
Hamlet/Band (30–50)	**Worked**	Fluid flotillas coordinated by a *Panglima* via consensus; fission resolves conflict instantly[55].
Village (150–500)	**Worked (Rarely)**	Temporary seasonal moorage during monsoons; deeply unstable without a land-based patron[47].
District to Planet	**Failed**	Incapable of scaling. High mobility and the cultural rejection of material accumulation prevents the creation of complex institutions.

Capture Test: Piracy and Sedentarization

Internal capture by a dark-triad individual is virtually impossible in a purely nomadic state. A psychopathic *Panglima* attempting to assert coercive control over a band would wake up to an empty ocean; his subjects would simply sail away in the night, exercising the ultimate veto of exit[49].

However, external capture by state actors is their historical Achilles' heel. When functioning under a powerful patron state (like Malacca), dark-triad rulers utilized the Orang Laut as proxy weapons to terrorize rival ports and capture slaves for spice plantations[62]. In the modern era, the capture is absolute. Westphalian nation-states (Myanmar, Thailand, Malaysia) view borderless nomads as a fundamental security threat. Through the enforcement of rigid maritime borders, the establishment of marine national parks (which explicitly ban the traditional logging required to build a *kabang*), and forced sedentarization programs, states have captured the nomads, reducing them to marginalized, impoverished shore-dwellers or stateless tourist attractions[50].

Implementability after the Fall

If the permanent loss of industrial supply chains and central state reach occurs, these historical

models of dispersed governance offer critical blueprints for institutional reconstruction at varying scales.

Scale & Model	Minimum Viable Version	Prerequisites to Start	First Failure to Expect
Household (4–10) *Model: Sea Nomad*	The household operates as an economically autonomous, highly mobile foraging unit capable of rapid relocation to avoid local resource depletion or violence.	Essential survival skills, localized ecological knowledge, and a reliable transport mechanism (boat, cart, or pack animals).	Severe vulnerability to sudden trauma or illness, as the nomadic household lacks the localized mutual-insurance net of a static community.
Village (300) *Model: Icelandic Hreppur*	The village formalizes a strict mutual insurance pact and common-pool resource management protocol, enforcing exclusivity over local agriculture and pasturage.	A shared calendar for resource extraction (e.g., grazing dates), physical ledgers to track property and debts, and a designated physical meeting place for arbitration.	Free-rider problems. Without the threat of social ostracization or violent private enforcement, individuals will inevitably overgraze the commons or refuse to pay into the poor-relief fund.
District (3,000) *Model: Hansetag / Althing*	Direct consensus fails at this scale. The district relies on an annual assembly (*Thing*) where representatives negotiate trade, standardize weights, and arbitrate inter-village disputes using	A recognized Lawspeaker (a human or recorded repository of legal precedent), standardized ledgers, and a shared commitment to an embargo (*Verhansung*) against rogue	The Tithe Trap. The district will attempt to levy a minor tax for common defense or infrastructure. A Machiavellian faction will capture the collection mechanism, converting public funds into private

	economic ostracism.	actors.	wealth, thereby initiating an oligarchy.

Principles

Principle	Testable Sentence
The Embargo Principle	Institutions lacking a central executive must rely on distributed economic ostracism (embargo/boycott) to enforce legal and commercial norms against aggressive actors.
The Mobility Defense Principle	Purely consensual, egalitarian governance is only sustainable when dissatisfied participants possess the physical and economic ability to exit the system seamlessly.
The Centralization by Capital Principle	Stateless systems that successfully generate economic surplus will inevitably spawn capital concentration, which dark-triad actors will use to purchase coercive monopolies.
The Cartel Vulnerability Principle	Dispersed networks originally formed for mutual defense (e.g., guilds) will inherently trend toward rent-seeking, prioritizing the violent suppression of external competition over the efficiency of the broader economy.
The Westphalian Supremacy Principle	Transnational or dispersed non-state networks cannot survive in direct spatial competition with territorial entities capable of fielding permanent, tax-funded standing armies.

Synthesis

Summary of Robust Findings:

Dispersed polities can successfully coordinate complex economic and legal frameworks—from trans-continental supply chains to intricate tort law—entirely without a central state apparatus. They achieve this through private enforcement, multilateral reputation networks, strict localized communes (*hreppar*), and the threat of severe economic or social ostracism (*Verhansung*). However, these systems are fundamentally unstable over deep historical time. If they fail to produce a surplus (Sea Nomads), they remain egalitarian but highly vulnerable to external state violence and forced sedentarization. If they succeed in producing a massive surplus (Iceland, Hanseatic League), they fall victim to internal capture; dark-triad actors hijack the network's capital streams (church tithes, trade monopolies) to establish violent, hereditary oligarchies. Furthermore, dispersed polities invariably generate massive negative externalities for non-members, operating more often as exclusionary, rent-seeking cartels than as champions of generalized liberty. Ultimately, dispersed arrangements are either assimilated by, or evolve into, territorial states possessing a monopoly on violence.

Contested or Open Questions:

The fundamental debate regarding dispersed economic networks remains unresolved: Did the Hanseatic League facilitate the expansion of the late medieval economy by solving the sovereign commitment problem through multilateral reputation (Greif, Milgrom, Weingast), or did it stunt European economic growth through violent monopolistic rent-seeking and the suppression of technological innovation (Ogilvie)? Similarly, the nature of stateless justice is contested: Was the Icelandic blood feud a finely tuned legal instrument that prevented chaotic violence by enforcing measured, reciprocal compensation (Miller), or was it simply the violent mechanism by which an entrenched, slave-owning elite maintained an oppressive oligarchy (Thorlaksson)?
