NA-01 Honeybee democracy: how a swarm chooses a home without a leader

Introduction: The Architecture of Decentralized Governance

In the context of the permanent loss of industrial supply chains and the retreat of state reach, the fundamental challenge facing human populations is the reconstruction of self-governance. As households rebuild their lives and scale into villages and districts, the necessity for robust, scalable decision-making frameworks becomes paramount. To identify architectural principles that can withstand the pressures of resource scarcity and the inevitable emergence of dark-triad traits—narcissism, Machiavellianism, and psychopathy—it is necessary to examine models of self-governance across deep time and biology.

One of the most profound natural benchmarks for collective, leaderless decision-making is the honeybee swarm (*Apis mellifera*). When a colony outgrows its hive, it undergoes reproduction by fission. Approximately 10,000 bees and a single queen depart to bivouac on a tree branch, while a subset of several hundred "scout" bees searches an area of roughly 70 square kilometers to locate, evaluate, and unanimously agree upon a new nest cavity[1]. The evolutionary stakes are absolute: an inadequate cavity results in the death of the colony during the ensuing winter. Remarkably, without any central executive, the swarm successfully identifies the single optimal site from a field of dozens of alternatives in nearly 90 percent of cases[3].

This document provides an exhaustive structural analysis of decentralized decision-making. By cross-examining the biological model of the honeybee swarm against historical human attempts at direct democracy—specifically the Athenian Assembly, the Icelandic Commonwealth, the New England Town Meeting, and the Swiss Landsgemeinde—this report establishes a comprehensive scale ledger and a rigorous capture test for post-collapse governance models.

The Biological Baseline: The Honeybee Swarm

The empirical understanding of swarm intelligence originated in the ruins of post-war Munich. In 1949 and 1951, German ethologist Martin Lindauer observed swarming bees performing the "waggle dance"—a symbolic communication system decoded by his mentor, Karl von Frisch—on the surface of the swarm cluster rather than on the wax combs of a hive[2]. Lindauer noted these bees carried no pollen or nectar; they were covered in soot and brick dust, indicating they were inspecting the chimneys and rubble of bombed-out buildings[2]. In his seminal 1955 paper, *Schwarmbienen auf Wohnungssuche* (Swarm Bees in Search of a Home), Lindauer established that these scouts were essentially holding a plebiscite on their future home[5].

Evaluation, Quorum Sensing, and Cross-Inhibition

Modern behavioral ecology, led by Thomas D. Seeley, quantified the parameters of this process.

In 2001, Seeley and P. Kirk Buhrman published *Nest-site selection in honey bees* in the journal *Behavioral Ecology and Sociobiology*, detailing experiments conducted on Appledore Island, Maine (42°58'N, 70°37'W)[8]. Because this 39-hectare island is treeless and lacks natural nesting cavities, the researchers could strictly control the swarm's options. They presented artificial swarms with an array of five nest boxes. Four were mediocre (e.g., 15 liters in volume), and one was optimal (40 liters in volume, roughly the size of a standard Langstroth deep box, with a 15-square-centimeter entrance positioned near the floor and facing south)[4]. In four out of five experimental trials, the swarm successfully chose the single optimal 40-liter site, proving the swarm operates via the "best-of-N" decision rule with extraordinary accuracy ($P = 0.0064$)[8].
When a scout discovers a potential site, she conducts a methodical, 40-minute internal inspection, pacing the walls to measure volume[4]. Upon returning to the swarm, she advertises the site via the waggle dance. The angle of the dance relative to vertical indicates direction, while the duration of the waggle run encodes distance (approximately 1 second per 1,000 meters)[2]. The absolute number of waggle circuits performed correlates perfectly with the scout's assessment of site quality; an outstanding site might elicit a vigorous dance of 100 circuits, while a mediocre site yields only a dozen[1].
Crucially, the swarm does not seek consensus. Instead, it relies on "quorum sensing." Seeley demonstrated that when approximately 10 to 20 bees (typically around 15) are simultaneously present at a single candidate site, the scouts sense that a quorum has been reached[2]. This mathematically eliminates cascading errors: a site that attracts 15 independent scouts simultaneously is one that multiple scouts have independently validated[4].
To resolve deadlocks between equal-quality sites, the swarm employs cross-inhibition via a "stop signal." As documented by Seeley, Visscher, Schlegel, Hogan, Franks, and Marshall in a 2012 *Science* paper (*Stop signals provide cross inhibition in collective decision-making by honeybee swarms*), scouts dancing for one site will actively seek out scouts dancing for a competing site. They lunge at the competitor and deliver a short, vibrating headbutt lasting 0.21 ± 0.10 seconds[9]. This negative feedback prevents the swarm from splitting. Mathematical modeling of this cross-inhibition, utilizing systems of ordinary differential equations (ODEs), reveals that the swarm undergoes a pitchfork bifurcation—a critical threshold where the system breaks symmetry and collapses support for alternatives, ensuring a rapid, unanimous decision comparable to lateral intraparietal neurons in the primate brain during binary-choice tasks[9].

The Limits of the Analogy: Kin Selection and Policing

Thomas Seeley's 2010 book *Honeybee Democracy* outlines five lessons for human groups: share mutual interests, minimize the leader's influence, seek diverse solutions, aggregate independently, and use quorum rather than consensus[2]. However, translating these biological mechanisms to human governance requires confronting the naturalistic fallacy.
The shared mutual interest of the swarm is a product of genetic relatedness (kin selection) and lethal coercion, variables absent in human populations. The apparent harmony of the leaderless hive is ruthlessly enforced by "worker policing," a concept formalized by Francis L.W. Ratnieks in 1988 (*Reproductive harmony via mutual policing by workers in eusocial Hymenoptera*,

published in *The American Naturalist*)[17]. While worker bees are nominally sterile, they possess ovaries and can lay unfertilized eggs that develop into males. Because a worker is more closely related to her own son (relatedness = 0.5) than to her brothers (the queen's sons, relatedness = 0.25), there is a strong genetic incentive to cheat the system[20]. To prevent this tragedy of the commons, worker bees actively patrol the combs, identifying and consuming 99 percent of all eggs laid by other workers[21]. Because the queen marks her eggs with a specific viability-independent pheromone, police workers can perfectly discriminate and destroy illicit offspring[24]. The biological model lacks dark-triad traits because evolution has eradicated the incentive for deception through lethal olfactory policing—a luxury human governance cannot replicate.

Evaluation of the Biological Model

To establish a baseline, we must subject the honeybee swarm to the same analytical framework that will be applied to human governance models.

Three Realities Separated:

- **Stated Reality (Anthropomorphic Projection):** Human observers historically characterized the hive as a perfect, harmonious monarchy (or later, a utopian democracy) where individuals selflessly sacrificed for the greater good without coercion.
- **Recorded Reality:** Empirical biology demonstrates that the swarm relies on brutal, continuous mutual policing. Workers consume 99 percent of illicitly laid eggs to enforce reproductive monopolies[21].
- **Inferred Reality:** Modern scholarship infers that swarm intelligence is an algorithmic process of ordinary differential equations, quorum thresholds, and pitchfork bifurcations driven strictly by inclusive fitness and kin selection[9].

Capture Test: A dark-triad actor (e.g., a mutant worker bee attempting to hoard reproductive resources) would theoretically capture the system by laying eggs. However, the system violently resists capture because the mutant cannot replicate the queen's specific egg-marking pheromone, resulting in immediate detection and destruction of the illicit offspring by the policing collective[24].

Scale Rung (Population)	Status	Analysis
Household (4–10)	**Operates & Works**	At the scale of initial scout interactions, information exchange is highly efficient.
Hamlet/Band (30–50)	**Operates & Works**	Represents the active quorum threshold required to trigger collective movement.
Village (150–500)	**Operates & Works**	Represents the total

		number of active scout bees field-testing sites.
Parish/District (1,500–5,000)	**Operates & Works**	Sub-population of the total swarm.
Town/Watershed (15k–50k)	**Operates & Works**	Represents the upper limit of a single massive colony (10,000 to 50,000 bees) functioning unitarily.
Region (0.5M–5M)	**Never Tried**	Logistically impossible; bees reproduce by fission (swarming) long before reaching this population density to avoid resource exhaustion.
Nation (50M–500M)	**Never Tried**	Biologically irrelevant.
Planet (8B)	**Never Tried**	Biologically irrelevant.

Historical Human Arrangements: The Athenian Assembly

The Athenian Assembly (Ekklesia), operating from roughly 508 to 322 BCE, represents the classical archetype of human leaderless governance. It required direct participation rather than representation.

Three Realities Separated:

- **Stated Reality:** The Athenians claimed their system was the pure embodiment of *demokratia*, a political structure where every adult male citizen had an equal voice, and statecraft was driven by collective, rational deliberation.
- **Recorded Reality:** The system required a massive quorum of 6,000 citizens out of a total citizen population of roughly 30,000 to 40,000 to pass major decrees, such as ostracism or the granting of citizenship[26]. Achieving this quorum often required physical compulsion, such as Scythian archers herding citizens into the Pnyx with red-dyed ropes. The Assembly was violently swayed by charismatic demagogues.
- **Inferred Reality:** Modern scholarship, including the work of Mogens Herman Hansen (1991, *The Athenian Democracy in the Age of Demosthenes*), infers that Athenian

democracy functioned not solely because of the mass assembly, but because an intricate bureaucracy of sortition (random selection by lot) broke up factional power bases and acted as a structural cross-inhibition mechanism[27].

Capture Test: A dark-triad actor like Alcibiades successfully captured the Assembly through extreme wealth, narcissism, and charismatic manipulation. He whipped the crowd into aggressive military adventurism, culminating in the disastrous Sicilian Expedition (415 BCE)[28]. The primary feature that resisted capture was the *graphe paranomon* (instituted around 415 BCE), a legal writ allowing any citizen to prosecute a peer for making an illegal or contradictory proposal, subjecting the proposer to heavy fines or exile[26]. This served as a human equivalent to the honeybee "stop signal," introducing severe friction to dangerous ideological cascades.

Scale Rung (Population)	Status	Analysis
Household (4–10)	**Operates & Works**	Basic unit of the *oikos*, operating efficiently via patriarchal consensus.
Hamlet/Band (30–50)	**Operates & Works**	Size of small local councils (*demes*), functioning with high accountability.
Village (150–500)	**Operates & Works**	Corresponds to the Council of 500 (*Boule*), which prepared the agenda. Selection by lot made this highly effective.
Parish/District (1,500–5,000)	**Marginal / Fails**	When scaled to 6,000 for the Assembly quorum, rational deliberation degraded into crowd psychology and susceptibility to demagoguery.
Town/Watershed (15k–50k)	**Fails**	The total citizen body of 30,000 could never physically deliberate together; it relied on the 6,000 subset and suffered massive participation

		inequality.
Region (0.5M–5M)	**Never Tried**	Logistically impossible for a primary physical assembly.
Nation (50M–500M)	**Never Tried**	Logistically impossible.
Planet (8B)	**Never Tried**	Logistically impossible.

Historical Human Arrangements: The Icelandic Commonwealth

Operating from its settlement in 870 CE until 1262 CE, the Icelandic Commonwealth represents a historical attempt to govern a geographically expansive society using decentralized assemblies (the Althing) without an executive monarch or a state apparatus.

Three Realities Separated:

- **Stated Reality:** Nineteenth-century romantic nationalism framed the Commonwealth as a pristine, egalitarian utopia of free farmers who settled disputes peacefully through a sophisticated legal code and parliamentary gatherings[29].
- **Recorded Reality:** Society was strictly hierarchical, structured around 39 *goðorð* (chieftaincies) held by *goðar* (chieftains). These titles were private property that could be bought, sold, or inherited. Lacking an executive monopoly on violence, legal verdicts could only be enforced through blood feud, balanced temporarily by wergild (blood money)[30].
- **Inferred Reality:** Anthropological and historical analyses, such as Jesse Byock's *Viking Age Iceland* (2001), infer that unregulated decentralization without state enforcement mechanisms inevitably triggers wealth concentration and feudalism[29]. The law merely codified the power dynamics of the strongest factions.

Capture Test: The system was structurally designed to be captured. During the Sturlungaöld (Age of the Sturlungs, c. 1220–1264 CE), individuals with Machiavellian traits systematically exploited the lack of central authority. The Sturlung family utilized violence, debt manipulation, and marriage alliances to aggressively accumulate *goðorð*[29]. By the late 1250s, all 39 chieftaincies were monopolized by just three families[30]. This intense civil war resulted in total systemic collapse. To halt the bloodshed, the population signed the *Gamli sáttmáli* (Old Covenant) in 1262 and 1264, permanently surrendering Icelandic independence and legal autonomy to King Hákon Hákonarson of Norway[31].

Scale Rung (Population)	**Status**	**Analysis**

Household (4–10)	**Operates & Works**	Information symmetry is high; survival dependencies align interests.
Hamlet/Band (30–50)	**Operates & Works**	Localized farmsteads managed resources effectively through customary law.
Village (150–500)	**Marginal / Fails**	Local assemblies (Things) often devolved into armed standoffs if competing *goðar* possessed equal retinues.
Parish/District (1,500–5,000)	**Fails**	Quarter courts failed to resolve disputes impartially due to systemic bribery and intimidation.
Town/Watershed (15k–50k)	**Fails**	The national Althing became a venue for factional warfare rather than democratic deliberation, culminating in civil war.
Region (0.5M–5M)	**Never Tried**	Did not reach this population scale.
Nation (50M–500M)	**Never Tried**	Logistically impossible.
Planet (8B)	**Never Tried**	Logistically impossible.

Historical Human Arrangements: The New England Town Meeting

The New England Town Meeting, originating in the 17th century, is widely considered the foundational institution of American participatory democracy, where the entire adult

population gathers annually as the legislature to dictate municipal budgets.

Three Realities Separated:

- **Stated Reality:** The institution is revered as the ultimate expression of civic virtue and egalitarian governance, where every citizen's voice carries equal weight in the stewardship of the community[34].
- **Recorded Reality:** Empirical political science paints a grim picture of participation. Frank M. Bryan's 2004 book *Real Democracy: The New England Town Meeting and How It Works* represents a staggering data collection effort, observing 1,500 town meetings over 30 years. Bryan quantified that participation scales inversely with population. In modern meetings, attendance rarely exceeds 20 percent of registered voters. Furthermore, verbal participation is highly unequal, dominated by older, wealthier, and more educated men[35].
- **Inferred Reality:** Modern scholarship infers that requiring physical presence for direct democracy intrinsically disenfranchises the working class, single parents, and marginalized groups who lack the free time to endure grueling five-hour debates over minor line items[35].

Capture Test: The town meeting is highly susceptible to capture by local elites, historically referred to as "Village Tweeds." During the 19th century, as urban industrialism swelled populations, these actors rigged meetings by monopolizing the agenda and utilizing parliamentary procedures (e.g., Robert's Rules of Order) to exhaust opposition. In Jane Mansbridge's 1980 study *Beyond Adversary Democracy*, her empirical observation of a Vermont town (pseudonym "Selby") revealed that local working-class citizens actively self-censored or stopped attending entirely due to the psychological exhaustion of arguing against highly articulate, wealthy newcomers[34]. Resistance to capture relies heavily on external state laws enforcing transparent warning periods for meetings and the eventual transition to Australian (secret) balloting for major budgetary items[35].

Scale Rung (Population)	Status	Analysis
Household (4–10)	**Operates & Works**	N/A to the formal meeting, but reflects familial consensus.
Hamlet/Band (30–50)	**Operates & Works**	Extremely high attendance and functional consensus.
Village (150–500)	**Operates & Works**	Bryan (2004) confirms this is the optimal scale for maximum democratic efficiency, where participation rates hit their

		peak[35].
Parish/District (1,500–5,000)	**Marginal / Fails**	Attendance plummets below 20%. Meetings become lengthy, complex, and dominated by factions with the resources to endure them.
Town/Watershed (15k–50k)	**Fails**	Total breakdown. Physical constraints of Grange halls make mass assembly impossible. Most towns this size abandon the meeting for representative councils.
Region (0.5M–5M)	**Never Tried**	Logistically impossible.
Nation (50M–500M)	**Never Tried**	Logistically impossible.
Planet (8B)	**Never Tried**	Logistically impossible.

Historical Human Arrangements: The Swiss Landsgemeinde

The Landsgemeinde is a primary assembly operating in a few Swiss cantons since the 13th century, where citizens gather in a public square to vote on laws and budgets by raising their hands (or historically, their swords).

Three Realities Separated:

- **Stated Reality:** Proponents claim the Landsgemeinde is the purest surviving form of continuous direct democracy in the world, fostering total transparency and civic responsibility[37].
- **Recorded Reality:** The physical requirement of public voting exerts massive social pressure, effectively suppressing minority dissent. The tradition has historically been weaponized to exclude marginalized groups. At the federal level, Swiss men voted in 1959 to reject women's suffrage by a margin of 67%[39]. Even after the federal mandate in 1971, cantons utilizing the Landsgemeinde fiercely protected their "decentralized autonomy" to continue disenfranchising women.
- **Inferred Reality:** Decentralization does not inherently generate justice. Old does not mean good, and small does not mean fair. Without a superseding rights framework, direct democracy is a highly effective tool for enforcing conservative cultural hegemony.

Capture Test: The system was permanently captured by patriarchal local elites who used the sheer inertia of tradition to block civil rights. In the canton of Appenzell Innerrhoden, male voters at the Landsgemeinde repeatedly rejected women's suffrage, including a decisive "no" vote in 1989[41]. Local activist Theresia Rohner faced intense harassment and anonymous threats when she initiated a lawsuit against the canton. The capture was only broken by external, centralized force: on November 27, 1990, the Swiss Federal Supreme Court (Federal Tribunal) ruled that the canton's exclusion of women violated the federal constitution, forcing Appenzell Innerrhoden to grant women the vote at the 1991 Landsgemeinde[39].

Scale Rung (Population)	Status	Analysis
Household (4–10)	**Operates & Works**	Functions via family consensus.
Hamlet/Band (30–50)	**Operates & Works**	Extreme social cohesion ensures rapid decision-making.
Village (150–500)	**Operates & Works**	Effective public voting, though social pressure suppresses dissenting opinions.
Parish/District (1,500–5,000)	**Marginal / Fails**	Still operational in places like Appenzell Innerrhoden, but highly susceptible to majoritarian tyranny and the exclusion of minorities[39].
Town/Watershed (15k–50k)	**Fails**	Due to the logistical impossibility of hand-counting tens of thousands of raised hands, larger cantons have abandoned the practice.
Region (0.5M–5M)	**Never Tried**	Logistically impossible.
Nation (50M–500M)	**Never Tried**	Logistically impossible.

Planet (8B)	**Never Tried**	Logistically impossible.

The Strongest Case Against Leaderless Democracy

The most formidable argument against the viability of decentralized, leaderless direct democracy in human populations is structural, articulated through the works of Robert Michels, Jo Freeman, Jane Mansbridge, and Robert Dahl.

In 1911, German sociologist Robert Michels published *Political Parties*, proposing the "Iron Law of Oligarchy." Michels argued that all organizations, regardless of their foundational democratic intentions, inevitably devolve into oligarchies[43]. The mechanism is algorithmic: as tasks scale in complexity, the collective must delegate administration to a competent minority. This minority quickly monopolizes information, skills, and material resources, rendering themselves indispensable. Driven by an inherent human desire to maintain status, this elite eventually utilizes undemocratic means to silence opposition[43].

Feminist scholar Jo Freeman expanded upon this in her 1972 essay *The Tyranny of Structurelessness*. Analyzing the leaderless governance models of the radical feminist movement, Freeman proved that there is no such thing as a "structureless" group. When formal, transparent hierarchies are abolished, informal hierarchies immediately emerge based on charisma, friendship networks, and resource access. Because these informal structures are unacknowledged, they are entirely unaccountable, allowing Machiavellian actors to wield supreme power while hiding behind the veneer of a "leaderless" collective[45].

Finally, Jane Mansbridge (1980) and Robert Dahl demonstrate that the honeybee analogy collapses upon the distinction between "unitary" and "adversary" societies[34]. The honeybee model assumes a unitary society—where all members possess fundamentally identical long-term interests and genetic imperatives. Human societies are intrinsically adversary, characterized by irreconcilable conflicts over resource distribution, ideological values, and property rights. Applying a biological demand for consensus to human adversary groups almost universally results in the oppression of minority factions. As seen in the New England Town Meeting and the Swiss Landsgemeinde, relying on direct democracy without a robust, encoded bill of rights enforced by a higher executive authority invites majoritarian tyranny.

Implementability after the Fall

To implement leaderless governance post-collapse (operating with no state, no grid, and no internet), architectural constraints must be rigidly respected:

Household (4 to 10 individuals):

- **Minimum Viable Version:** Nightly consensus gathering around the communal table. Total transparency of stored resources and caloric distribution.
- **Requirements:** None beyond a shared language and absolute shared risk.
- **First Failure to Expect:** Interpersonal grudges or severe resource scarcity leading to secret caloric hoarding, destroying the unitary interest.

Village (300 individuals):

- **Minimum Viable Version:** A monthly Town Meeting. Operates on a strict Quorum sensing model (e.g., decisions pass only if 150 adults attend, bypassing consensus).

- **Requirements:** Literacy, a shared physical paper calendar/ledger, a central meeting hall capable of holding 300 people, and a neutral timekeeper/moderator randomly selected by lot (sortition) each month to prevent agenda capture.
- **First Failure to Expect:** *The Tyranny of Structurelessness*. Charismatic extroverts and local food-surplus holders will dominate the verbal discussion. Working-class individuals will stop attending out of physical exhaustion, transferring unaccountable power to a shadow oligarchy.

District (3,000 individuals):

- **Minimum Viable Version:** The system must transition to a representative assembly; primary direct democracy fails catastrophically here. Neighborhoods of 100 people randomly select (by lot) one delegate to serve a single 6-month term at a district council.
- **Requirements:** Reliable human courier networks, verifiable paper trails for delegate mandates, secret balloting, and a robust mechanism for the immediate recall of delegates.
- **First Failure to Expect:** *The Iron Law of Oligarchy*. Delegates will discover methods to manipulate the sortition process, refuse to step down, and demand executive privileges, thereby recreating a bureaucratic, extractive state apparatus.

Contested or Open Questions

The transposition of biological swarm intelligence to human political systems leaves several critical mechanisms contested. First, at what exact population density does the "social friction" of cross-inhibition (e.g., the *graphe paranomon*) transition from an asset that prevents bad

ideas into a liability that causes permanent legislative deadlock? Second, while mathematical modeling proves that a quorum threshold of 15 independent evaluators optimally serves a population of 10,000 identical bees, it remains unknown how to scale this quorum variable to determine optimal voting thresholds (e.g., simple vs. supermajorities) for high-stakes decisions in human adversary populations characterized by stark information asymmetry. Finally, given that the Athenian defense against oligarchy relied heavily on sortition, the mechanics of implementing mathematically secure, manipulation-proof random selection in a post-collapse society lacking cryptographic digital tools remains an unresolved engineering challenge.

Summary of Robust Findings

Honeybee swarms evaluate candidate nest sites using independent scouts who communicate quality via the waggle dance, aggregating support until a quorum of 15 bees is reached. The swarm prevents deadlock via a "stop signal" that cross-inhibits competing factions, resulting in a 90% decision success rate without centralized leadership. However, this biological model functions smoothly solely because genetic relatedness and lethal mutual policing eradicate conflicts of interest. Human societies, possessing inherently adversarial interests, cannot rely on natural harmony and are aggressively targeted by actors exhibiting dark-triad traits. Historical attempts at leaderless direct democracy—including the Athenian Assembly, the Icelandic Commonwealth, the New England Town Meeting, and the Swiss Landsgemeinde—demonstrate a severe scale limit. Once a population surpasses the scale of a village (roughly 500 people), direct assembly becomes logistically unwieldy and physically exclusionary. Consequently, the Iron Law of Oligarchy and the Tyranny of Structurelessness take effect, guaranteeing that informal, unaccountable elites will capture the governance apparatus unless aggressively constrained by external rights frameworks, secret balloting, and sortition.

Principles

- **The Principle of Independent Aggregation:** Information must be gathered and validated by individuals acting independently to prevent viral information cascades and the compounding of early errors.
- **The Principle of Cross-Inhibition:** A robust decision-making system requires a structural mechanism (a "stop signal") that allows dissenting factions to actively degrade the momentum of a majority, forcing a higher evidentiary threshold for action.
- **The Principle of Quorum Over Consensus:** Mandating absolute consensus grants veto power to extremist minorities; establishing a high quorum threshold balances the need for analytical accuracy with the necessity of speed.
- **The Iron Law of Oligarchy:** In any human organization scaled beyond face-to-face familiarity, administrative complexity will inexorably produce an entrenched, self-serving elite unless aggressively counteracted by sortition.
- **The Tyranny of Structurelessness:** The removal of formal democratic structures does not eliminate hierarchies; it merely drives them underground, creating informal networks of power that are entirely unaccountable to the collective.
