GL-05 The arithmetic and logistics of nesting from household to planet

1. The Formal Arithmetic of Nesting Ladders

The foundational problem of political scale is the mathematical friction between face-to-face deliberative capacity and aggregate population size. Direct democracy functions within cognitive and communicative boundaries where participants can evaluate one another's character, track reputational histories, and deliberate without specialized intermediaries. When a polity expands beyond the horizon of direct mutual observation, it must choose between two organizational morphologies: a centralized bureaucratic hierarchy with direct individual subordination, or a federated council system that nests lower-tier assemblies into higher-tier deliberative bodies via delegation.

The structure of a nested system is determined by two variables: the base population unit (N_0) and the delegation ratio (r), defined as the number of lower-tier constituent units represented by a single delegate in the assembly immediately above. If a uniform delegation ratio r is maintained across all levels, the number of assemblies or delegate seats N_k at any vertical layer k follows an exponential decay function:

$$N_k = \frac{N_0}{r^k}$$

The vertical depth L required to compress a base population N_0 into an apex deliberative body of target size N_{apex} is given by:

$$L = \left\lceil \frac{\ln(N_0) - \ln(N_{\text{apex}})}{\ln(r)} \right\rceil$$

For a council to deliberate—engaging in substantive debate, mutual persuasion, and unscripted compromise rather than procedural voting on pre-packaged agendas—its membership must remain small. Following the institutional benchmarks of classical antiquity and organizational sociology, a functional deliberative apex comprises between 10 and 100 delegates. Beyond 100 to 150 members, assemblies experience severe communicative coordination bottlenecks: speech time must be strictly rationed, floor access requires centralized party or factional management, and power shifts inevitably to permanent secretariats, agenda-setting committees, and presidiums.

Two base units define the bottom of the ladder: an individual base ($N_0 = 8 \times 10^9$) representing the contemporary global human population, and a household base ($H_0 = 1.6 \times 10^9$) assuming an average household size of $s = 5$, characteristic of pre-industrial agrarian demography[1]. Four distinct delegation ratios illustrate the structural trade-offs of nested design:

- **Ratio 1:10 (The Primary Squad / Working Group)**: Reflects the span of immediate mutual surveillance and close collaboration, typical of small primary groups, hunting parties, and military squads.
- **Ratio 1:50 (The Deliberative Committee / Athenian *Prytaneis*)**: Approximates the executive standing committee of the Athenian *Boule*, balancing demographic breadth with the capacity for unamplified oral deliberation.
- **Ratio 1:150 (Dunbar's Neocortical Threshold)**: Derived from Robin Dunbar's (1992) neuro-evolutionary limit on stable, reciprocal human social networks where individuals maintain personal social knowledge without formal institutional monitoring.
- **Ratio 1:500 (The Representative Plenum / Athenian *Boule*)**: Represents the upper boundary of an open-air assembly capable of collective listening without electronic media, matching the Cleisthenic Council of 500.

Computational Ladders Across Four Ratios

The tables below provide the step-by-step arithmetic from base population to deliberative apex for both individual and household foundations[1].

Tier / Layer	Ratio 1:10	Ratio 1:50	Ratio 1:150	Ratio 1:500
Layer 0 (Base)	8,000,000,000 Individuals	8,000,000,000 Individuals	8,000,000,000 Individuals	8,000,000,000 Individuals
Layer 1	800,000,000 Delegates	160,000,000 Delegates	53,333,333 Delegates	16,000,000 Delegates
Layer 2	80,000,000 Delegates	3,200,000 Delegates	355,556 Delegates	32,000 Delegates
Layer 3	8,000,000 Delegates	64,000 Delegates	2,370 Delegates	**64 Delegates (Apex)**
Layer 4	800,000 Delegates	1,280 Delegates	**15.8 Delegates (Apex)**	0.13 (Sub-unitary)

Layer 5	80,000 Delegates	**25.6 Delegates (Apex)**	0.11 (Sub-unitary)	—
Layer 6	8,000 Delegates	0.51 (Sub-unitary)	—	—
Layer 7	800 Delegates	—	—	—
Layer 8	80 Delegates	—	—	—
Layer 9	**8 Delegates (Apex)**	—	—	—
Layer 10	0.8 (Sub-unitary)	—	—	—

Note: For an individual base of 8 billion, an apex council of $N \leq 100$ requires 9 tiers at ratio 10, 5 tiers at ratio 50, 4 tiers at ratio 150, and 3 tiers at ratio 500[1].

Tier / Layer	Ratio 1:10	Ratio 1:50	Ratio 1:150	Ratio 1:500
Layer 0 (Base)	1,600,000,000 Households	1,600,000,000 Households	1,600,000,000 Households	1,600,000,000 Households
Layer 1	160,000,000 Delegates	32,000,000 Delegates	10,666,667 Delegates	3,200,000 Delegates
Layer 2	16,000,000 Delegates	640,000 Delegates	71,111 Delegates	6,400 Delegates
Layer 3	1,600,000 Delegates	12,800 Delegates	474 Delegates	**12.8 Delegates (Apex)**
Layer 4	160,000 Delegates	256 Delegates	**3.16 Delegates**	0.03 (Sub-unitary)

			(Apex)	
Layer 5	16,000 Delegates	**5.12 Delegates (Apex)**	0.02 (Sub-unitary)	—
Layer 6	1,600 Delegates	0.10 (Sub-unitary)	—	—
Layer 7	160 Delegates	—	—	—
Layer 8	**16 Delegates (Apex)**	—	—	—
Layer 9	1.6 Delegates	—	—	—
Layer 10	0.16 (Sub-unitary)	—	—	—

Note: For a household base of 1.6 billion ($s = 5$), an apex council of $N \leq 100$ requires 8 tiers at ratio 10, 5 tiers at ratio 50, 4 tiers at ratio 150, and 3 tiers at ratio 500[1].

The arithmetic exposes an inescapable structural trade-off between vertical transmission depth and horizontal representational intimacy. A ratio of $1:10$ preserves intimate mutual oversight: every delegate is personally known to, and constantly monitored by, their nine electors. However, bridging the gap to a global population requires 8 intermediate tiers above the household, resulting in a 9-step ladder to an apex council of 16 members, or 10 steps to a unitary executive[1]. As demonstrated below, this vertical depth introduces catastrophic transmission latency, cumulative information decay, and extreme agency slack.

Conversely, a ratio of $1:500$ compresses the planetary ladder into 3 vertical tiers above the household base, yielding an apex assembly of 13 delegates[1]. This compression eliminates vertical lag, but destroys direct social accountability at the primary level. A single delegate chosen by 500 households (2,500 people) cannot be monitored through informal reputational mechanisms. Selection at this scale requires formal campaign apparatuses, public rhetoric, and factional mobilization, opening the system to charismatic demagoguery and elite coordination.

The intermediate ratios of $1:50$ and $1:150$ balance these pressures. A ratio of $1:150$ matches the cognitive limit of mutual monitoring while compressing the planetary ladder to 4 vertical tiers[1]. Layer 1 corresponds to a village or urban neighborhood assembly, Layer 2 to a district council representing 22,500 households (112,500 individuals), Layer 3 to a bioregional

assembly of 3.375 million households (16.88 million individuals), and Layer 4 produces a planetary council of 3 to 16 members[1].

2. The Principal-Agent Chain: Signal Attenuation, Agency Drift, and Deliberation Latency

When authority is nested through multi-tiered delegation, governance faces two compounding sources of degradation: the informational degradation of the communicative signal, and the opportunistic divergence of the agents.

Theoretical Mechanics of Hierarchical Transmission Decay

Gordon Tullock (1965) in *The Politics of Bureaucracy* formulated the administrative "loss of control" as an exponential decay process[2]. Although Tullock focused on the downward transmission of administrative commands within bureaucratic hierarchies, Anthony Downs (1967) in *Inside Bureaucracy* demonstrated that the inverse dynamic governs upward information flows. Downs codified this as the "Law of Decreasing Control": the greater the number of vertical administrative tiers through which an instruction or observation must pass, the greater the distortion, condensation, and selective filtering applied to that signal[4].

Delegates at each intermediate council are not passive communication channels. They must summarize the diverse debates, compromises, and local knowledge of their sending assembly into a coherent negotiating position. In doing so, delegates selectively omit information that contradicts their personal preferences or exposes local administrative failures[4]. If the transmission fidelity of an imperative mandate across a single tier is represented by $f \in (0, 1)$, the cumulative fidelity I_L of the signal reaching layer L is:

$$I_L = I_0 \cdot f^L$$

Compounding this informational noise is agency drift. Jean Tirole (1986) expanded the formal economics of multi-tier delegation in *Hierarchies and Bureaucracies*, proving that adding intermediate levels creates opportunities for collusion[5]. Intermediate supervisors or delegates inevitably form horizontal coalitions with their peers, trading reciprocal favors and developing collective interests distinct from those of their base constituents[5]. If an opportunistic delegate introduces an agency bias or rent-extraction factor $\mu \in (0, 1)$ at each tier, the residual alignment A_L of the apex delegate with the original household principal is:

$$A_L = A_0 \cdot (1 - \mu)^L$$

Quantitative Degradation Across Tiers

The mathematical consequences of multi-tiered delegation on signal fidelity and agent alignment are stark. The table below models residual fidelity and alignment from the household

base to the deliberative apex council ($N \leq 100$) across the four delegation ratios, using high ($f = 0.95$), moderate ($f = 0.90$), low ($f = 0.80$), and critical drift ($f = 0.70$) retention assumptions per tier[1].

Ratio (r)	Tiers to Apex (L)	Apex Size (Delegates)	High Fidelity (f=0.95)	Moderate Fidelity (f=0.90)	Low Fidelity (f=0.80)	Critical Drift (f=0.70)
$1:10$	8	16.0	66.3%	43.1%	16.8%	5.8%
$1:50$	5	5.1	77.4%	59.0%	32.8%	16.8%
$1:150$	4	3.2	81.5%	65.6%	41.0%	24.0%
$1:500$	3	12.8	85.7%	72.9%	51.2%	34.3%

Data derived from recursive exponential decay models across multi-tiered principal-agent chains[1].

The arithmetic demonstrates the vulnerability of hyper-localist council systems. A ratio of $1:10$, celebrated by council-communist and radical-democratic theorists for its personal accountability, requires 8 tiers to reach a planetary council[1]. Even under the assumption of 90% transmission fidelity per tier, less than 44% of the original constituent signal survives at the apex[1]. More than half of the informational content is eliminated or distorted by intermediate summarization and selective filtering[3].

If fidelity drops to 80% per hop—a realistic figure when councils must resolve contentious trade-offs—residual constituent control plummets to 16.8%[1]. The planetary apex operates almost entirely on institutional noise and the private preferences of upper-tier delegates. In contrast, a ratio of $1:150$ reaches the deliberative apex in 4 tiers, retaining 65.6% of signal fidelity under moderate conditions and 81.5% under high fidelity, illustrating the protective value of shallow vertical depth[1].

3. Communication Media, Physical Logistics, and Innisian Administrative Reach

The spatial reach and temporal endurance of any political architecture are bound by the physics of its communication infrastructure. In *Empire and Communications* (1950) and *The Bias of Communication* (1951), Harold Adams Innis established that the physical properties of

media structure the administrative capacities and institutional forms of human civilization[6].

Innisian Bias and Institutional Morphology

Innis categorized media along an axis of institutional bias:

- **Time-biased media**: Heavy, durable materials such as carved stone, wet clay tablets, and animal parchment[6]. Because their weight and production intensity resist rapid long-distance transport, they favor administrative decentralization, localized confederal networks, sacred customary authority, and generational continuity[6]. They bind communities across deep time but struggle to coordinate activity across wide geographic space[8].
- **Space-biased media**: Light, perishable, easily transportable materials such as Egyptian papyrus, wood-pulp paper, the electric telegraph, radio waves, and digital packets[6]. These media allow commands, accounting ledgers, and legislative instructions to traverse vast territories rapidly, enabling centralized military coordination, professionalized administrative bureaucracies, territorial expansion, and imperial law[6]. However, their ephemerality destabilizes customary traditions, creating cultural amnesia and rapid shifts in political authority[11].

When a society relies on space-biased media, real-time administrative feedback enables centralized command over continental scales[6]. The permanent loss of industrial supply chains, electrical grids, and automated information processing abruptly dissolves this spatial bias. Governance is thrown back onto the physical constraints of historical transportation and manual record-keeping.

Logistical Vectors in a Post-Grid Environment

In an off-grid environment, information transmission is governed by four primary physical vectors:

1. **Pedestrian Couriers**: Operating at 25 kilometers per day over unpaved, broken terrain. This represents the baseline human transit speed, requiring no specialized animal husbandry or mechanical infrastructure.
2. **Mounted Relay Couriers**: Operating at 120 to 150 kilometers per day. This system requires organized waystations, fresh horse rotations, systematic fodder supplies, and secure road networks, approximating the Roman *cursus publicus*, the Achaemenid *pirradaziš*, or the Mongol *Yam*.
3. **High-Frequency (HF) Ground-Wave and Sky-Wave Radio**: Operating in the 3 to 30 MHz band, powered by localized micro-hydro, solar, or woodgas generator banks. Propagation is instantaneous ($300,000\ \mathrm{km/s}$), but throughput is limited by manual Morse telegraphy or low-baud packet radio (50 to 300 baud). This decouples information transmission from physical transit, though it cannot transport human delegates.
4. **Paper Archives**: Rag-linen or plant-fiber paper inscribed with carbon or iron gall ink. Providing physical records stable for 300 to 1,000 years, this medium balances moderate spatial portability with high temporal stability, resisting magnetic corruption and physical degradation.

Latency Across the Eight Scale Rungs

To evaluate how physical media constrain confederal nesting, we model a complete policy cycle across the eight scale rungs. In a confederacy governed by imperative mandates (*mandat impératif*), an initiative cannot be enacted by decree. A proposal must originate at the base, travel up through successive councils, be debated at each level, reach the competent regional or continental assembly, and return downward for ratification or execution.
The model incorporates physical travel distances and deliberative assembly buffers: 1 day per local assembly (Hamlets, Villages), 3 days for intermediate councils (Districts, Watersheds, Regions) to convene, verify credentials, and vote, and 7 to 14 days for continental and planetary assemblies[1].

Scale Rung	Representative Population	Cumulative Radial Distance	Foot Travel (Round-Trip + Assembly Latency)	Horse Relay (Round-Trip + Assembly Latency)	Low-Power HF Radio (Round-Trip + Assembly Latency)
R0: Household	4–10	0 km	0 days	0 days	0 days
R1: Hamlet	30–50	1 km	1.1 days	1.0 days	1.0 days
R2: Village	150–500	5 km	2.4 days	2.1 days	2.0 days
R3: District	1,500–5,000	25 km	6.0 days	4.4 days	4.0 days
R4: Watershed	15,000–50,000	85 km	13.8 days	8.4 days	7.0 days
R5: Region	0.5M–5M	335 km	37.8 days (1.2 mos)	16.6 days (0.5 mos)	11.0 days
R6: Continent	50M–500M	1,835 km	164.8 days (5.4 mos)	48.6 days (1.6 mos)	18.0 days
R7: Planet	8 Billion	11,835 km	978.8 days (32.2 mos)	229.2 days (7.5 mos)	32.0 days

Calculations based on $25\ \mathrm{km/day}$ pedestrian transit, $120\ \mathrm{km/day}$ horse relay transit, and fixed assembly deliberative buffers[1].

The Physical Frontiers of Governance

The logistics of physical transport define the boundaries of nested confederalism:

The Pedestrian Horizon

If a post-grid confederation relies exclusively on foot couriers, effective governance cannot extend beyond the Watershed level (Rung 4, ~85 km radius)[1]. Within this boundary, a complete policy cycle requires approximately two weeks, allowing communities to coordinate seasonal labor, emergency mutual aid, and basic watershed management.

Beyond 85 kilometers, pedestrian latency becomes administratively paralyzing. Coordinating a Region (Rung 5) on foot requires nearly 38 days; a Continent (Rung 6) demands 5.4 months; and a planetary cycle takes 2.7 years[1]. In an environment characterized by erratic weather, armed raiders, and shifting crop yields, an assembly operating on a five-month feedback loop is functionally dead. Local crises will resolve through starvation, violence, or ad-hoc warlordism long before official confederal instructions return.

The Equine Horizon

Establishing a horse relay network expands the viable administrative radius to the Regional boundary (Rung 5, ~335 km radius)[1]. A 16.6-day round-trip cycle permits coordinated defensive mobilization, grain reserve sharing, and the enforcement of common legal charters across several million people.

Continental governance on horseback remains marginal: a 48.6-day (seven-week) latency window allows for slow constitutional deliberation, but collapses during high-tempo military crises[1]. Historically, this marked the outer limit of pre-telegraph confederacies: both the Dutch Republic and the early United States operated within a two-to-six-week communication window.

The HF Radio Decoupling

Deploying low-power HF radio decouples information speed from delegate travel. Communicative latency drops to pure assembly deliberative time: 11 days for a Region, 18 days for a Continent, and 32 days for the Planet[1].

However, this decoupling introduces a critical vulnerability: while *information* can travel by radio, *physical human delegates* cannot. If a confederacy relies on radio to pass legislation without convening delegates face-to-face, it becomes vulnerable to cryptographic spoofing, interception, signal jamming, and the capture of transmission hubs by local technical elites. If physical assemblies are retained to preserve trust and monitor delegates directly, the system remains bound by the physical transit times of foot and horse.

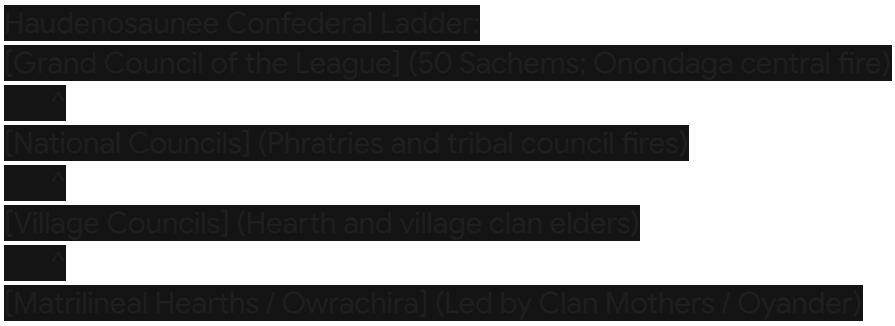
4. Comparative Empirical Ladders: Eight Historical and Modern Cases

To evaluate how nested structures have performed under real-world stresses, eight historical

and contemporary systems are examined across their structural mechanics, institutional records, scale capacities, and vulnerabilities to elite capture.

Case 1: The Haudenosaunee (Iroquois) League of Five (later Six) Nations

Formed along the southern shore of Lake Ontario, ethnohistorically dated between 1142 (via solar eclipse records) and 1450, and documented systematically by Lewis Henry Morgan (1851) and William N. Fenton (1998), the League confederated the Mohawk, Oneida, Onondaga, Cayuga, and Seneca, later admitting the Tuscarora in 1722[13].



The League was anchored in the *owrachira* (matrilineal hearth group), directed by the Clan Mother (*Oyander*)[13]. The governance ladder comprised four functional tiers:

1. *Hearth / Owrachira*: 20 to 100 individuals occupying communal bark longhouses.
2. *Village Council*: Clan-based male chiefs nominated and monitored by Clan Mothers.
3. *National Council*: Tribal councils organized into distinct phratries and moieties.
4. *Grand Council of the League*: Exactly 50 permanent sachem titles (*Hoyenah*) distributed across the nations (Onondaga 14, Cayuga 10, Oneida 9, Mohawk 9, Seneca 8), convening around the central council fire at Onondaga[13].

Decisions in the Grand Council required unanimous consensus achieved through a structured tripartite procedure. The "Older Brothers" (Mohawk and Seneca) deliberated first; once they reached unanimity, they passed the proposal across the fire to the "Younger Brothers" (Oneida and Cayuga). When the two benches agreed, the result was submitted to the Onondaga ("Firekeepers"), who could confirm the consensus or return it for reconsideration. The delegation ratio from total population (approximately 15,000 to 20,000 people in the seventeenth century) to the 50 sachems was approximately $1:300$ to $1:400$.

Tripartite Separation

- *Self-Conception*: The League understood itself as the *Kayanerehkowa* ("Great Law of Peace"), an everlasting longhouse sheltering the nations under the Tree of Peace, eliminating blood feud through the Condolence Ceremony and reciprocal wampum compensation.

- *Historical Record*: The authority of the 50 sachems was strictly limited to external diplomacy, boundary maintenance, and inter-tribal peace. Sachems held zero coercive police power over their clansmen. The Grand Council could not compel warrior societies or war chiefs to abstain from raiding. During the American Revolutionary War (1777), the unanimity mechanism fractured: the Oneida and Tuscarora allied with the American rebels, while the Mohawk, Seneca, and Cayuga allied with the British Crown, resulting in internal civil war and the destruction of the Onondaga council fire by the Sullivan Expedition in 1779.
- *Modern Scholarly Consensus*: Anthropologists (Tooker 1978; Snow 1994) demonstrate that the League was not a centralized state or a unified legislative body, but a dispute-resolution mechanism designed to halt internal cycles of revenge warfare while preserving full autonomy for its constituent nations.

Scale Ledger

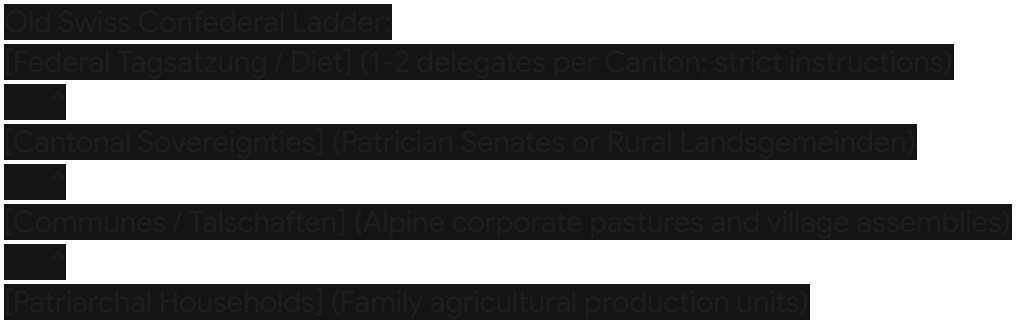
- *Household (4–10)*: Worked; stable matrilocal longhouse units.
- *Hamlet (30–50)*: Worked; extended clan settlements.
- *Village (150–500)*: Worked; primary deliberative arena where Clan Mothers exercised immediate oversight[14].
- *Parish/District (1,500–5,000)*: Worked; autonomous tribal national councils.
- *Watershed (15,000–50,000)*: Worked; total confederacy population (~20,000) was successfully bound by the Grand Council[13].
- *Region (0.5M–5M)*: Unattempted; demographic collapse from European pathogens and colonial encirclement halted geographic expansion.
- *Nation/Continent (50M–500M)*: Never tried.
- *Planet (8B)*: Never tried.

Capture Test

- *Vulnerability*: A charismatic war leader exploiting military honors to build personal followings, circumventing the sachems to drag the confederacy into external conflict.
- *Historical Case*: During the Beaver Wars of the mid-seventeenth century, war leaders bypassed the peace sachems, mobilizing raiding parties against the Huron, Petun, and Susquehannock to capture trade routes and captives, militarizing Haudenosaunee society.
- *Structural Defenses*: Clan Mothers held constitutional authority to nominate, advise, and depose (*strip the horns from*) any sachem who displayed warmongering, narcissism, or moral unfitness[14]. Furthermore, sachem titles were hereditary within lineages rather than acquired through personal wealth, preventing the formation of an open political market.

Case 2: The Old Swiss Confederacy (Eidgenossenschaft)

Originating with the Federal Charter of 1291 (*Bundesbrief*) between the forest cantons of Uri, Schwyz, and Unterwalden, expanding into the Thirteen-Canton Confederacy (1513–1798), and surviving until the French invasion of 1798.



The Old Swiss Confederacy possessed no permanent head of state, central treasury, standing army, or written constitution. Its structure spanned three nested tiers:

1. *Commune / Talschaft*: Valley and village communities managing common agricultural lands and alpine pastures (*Alpgemeinschaften*).
2. *Canton*: Sovereign mini-states divided into two constitutional types: rural cantons governed by annual open-air voting assemblies of weapon-bearing men (*Landsgemeinden*), and urban city-republics (Bern, Zurich, Lucerne, Basel) governed by merchant patricians and trade guilds.
3. *Federal Diet (Tagsatzung)*: An irregular assembly where each sovereign canton sent one or two delegates, casting a single collective vote per canton.

The delegation ratio at the confederal level was vast: 13 to 26 delegates represented approximately 1.5 million people (a ratio of roughly $1:60,000$ to $1:100,000$). However, delegates held zero discretionary authority. They operated under strict imperative mandates (*Instruktionsmandat*). If a question arose that was not covered by a delegate's written instructions, the *Tagsatzung* adjourned so delegates could return to their home cantons for consultation (*ad referendum*). Confederal decisions required unanimous consent among all sovereign members.

Tripartite Separation

- *Self-Conception*: A sacred covenant (*Eidgenossenschaft*) of free, egalitarian alpine communities united by oath to defend ancient communal liberties against Habsburg feudal tyranny.
- *Historical Record*: The confederacy was an asymmetric network of bilateral and multilateral military pacts dominated by wealthy urban oligarchies. The dominant cantons ruled extensive subject territories (*Untertanengebiete*), denying them political representation and subjecting them to economic exploitation. When rural populations revolted—most notably during the Swiss Peasant War of 1653—the urban and rural cantons put aside their religious differences to execute peasant leaders (such as Niklaus Leuenberger and Christian Schybi) and restore aristocratic control.
- *Modern Scholarly Consensus*: Modern historians (Würgler 2013; Maissen 2010) conclude that the Confederacy endured for five centuries not through egalitarian solidarity, but because its treaty structure maintained internal social control, generated profits through the export of mercenary soldiers (*Reisläufer*), and served as a useful geopolitical buffer

for European powers.

Scale Ledger

- *Household (4–10)*: Worked; patriarchal agrarian family units.
- *Hamlet (30–50)*: Worked; alpine grazing cooperatives.
- *Village (150–500)*: Worked; municipal communes (*Bürgergemeinden*).
- *Parish/District (1,500–5,000)*: Worked; valley jurisdictions (*Talschaften*).
- *Watershed (15,000–50,000)*: Worked; standard cantonal territory.
- *Region (0.5M–5M)*: Worked; successfully bound 1.5 million people across the alpine corridor for 500 years.
- *Nation/Continent (50M–500M)*: Failed/Never tried; modern federal state (1848) abandoned confederal unanimity to govern 9 million people.
- *Planet (8B)*: Never tried.

Capture Test

- *Vulnerability*: Patrician family cartels monopolizing cantonal administrative offices, capturing mercenary pensions (*Pensionen*), and turning communal offices into hereditary private property.
- *Historical Case*: The oligarchical consolidation of Bern in the seventeenth and eighteenth centuries, where fewer than 70 patrician families monopolized the Great Council (*Grosser Rat*) and the Small Council (*Kleiner Rat*), converting the canton into a closed dynastic state.
- *Structural Defenses*: Direct open-air democracy in the rural *Landsgemeinde* cantons; universal male possession of personal weaponry; and the rotational distribution of lucrative bailiff posts (*Landvogteien*) among sovereign cantons, which prevented any single city from establishing absolute hegemony over the confederation.

Case 3: The United Provinces of the Netherlands (The Dutch Republic)

Established by the Union of Utrecht in 1579 during the revolt against the Spanish Empire, lasting until the French Batavian invasion of 1795; governed a commercial world power of 1.5 to 2 million people[16].

The Republic comprised seven sovereign provinces: Holland, Zeeland, Utrecht, Gelderland, Overijssel, Friesland, and Groningen[16]. Its governance ladder spanned three tiers:

1. *City Councils (Vroedschappen)*: Self-selecting oligarchies of 20 to 40 wealthy burghers (*regenten*) holding lifetime appointments.
2. *Provincial Estates*: Assemblies composed of municipal council delegations and representatives of the rural nobility.
3. *States-General (Staten-Generaal)*: Convening daily in The Hague, where each province held exactly one vote regardless of population or wealth[16].

Decisions on foreign alliances, treaties, declarations of war, and general taxes required complete unanimity among all seven provinces. Furthermore, delegates operated under the doctrine of *last en ruggespraak* ("instruction and back-consultation")[16]. Delegates were legal proxies without discretionary voting power. When an unscripted policy issue arose, the States-General paused while delegates returned to their provincial assemblies, which in turn consulted municipal city councils[16]. The ratio was approximately 1 provincial vote per 250,000 citizens, but the actual decision-making class comprised roughly 2,000 regent families across the Republic.

Tripartite Separation

- *Self-Conception*: A restored biblical commonwealth defending religious conscience and local autonomy against Spanish Catholic tyranny, operating by rational consensus among free civic communities.
- *Historical Record*: The Republic was a merchant oligarchy dominated by the Province of Holland, which contributed 58% of the federal budget. Holland regularly coerced poorer inland provinces through financial leverage. The requirement of provincial unanimity paralyzed diplomacy and military mobilization during emergencies. Foreign powers routinely bribed delegates of minor provinces to veto federal defense expenditures. The state alternated between periods of republican regent rule led by the Grand Pensionary and militarized quasi-monarchical regimes led by the Princes of Orange (the Stadtholders).
- *Modern Scholarly Consensus*: Jonathan Israel (1995) and Maarten Prak (2005) demonstrate that *last en ruggespraak* maintained domestic liberty and financial credit for the merchant elite, but crippled federal fiscal-military coordination, leaving the Republic unable to survive eighteenth-century European power politics[16].

Scale Ledger

- *Household (4–10)*: Worked; urban commercial and rural farming households.
- *Hamlet (30–50)*: Worked; rural drainage boards.
- *Village (150–500)*: Worked; agricultural communities.
- *Parish/District (1,500–5,000)*: Worked; polder water management boards (*waterschappen*).
- *Watershed/Town (15,000–50,000)*: Worked; powerful chartered city governments (Amsterdam, Leiden, Haarlem, Rotterdam).
- *Region (0.5M–5M)*: Worked; the seven united provinces encompassed ~1.8 million people during the Golden Age.

- *Nation/Continent (50M–500M)*: Failed; could not coordinate continental land defense or integrate larger territories without collapsing into oligarchical deadlock.
- *Planet (8B)*: Never tried.

Capture Test

- *Vulnerability*: A popular military commander (the Stadtholder) mobilizing the army and urban mobs to bypass provincial assemblies, execute political opponents, and seize monarchical power.
- *Historical Case*: The catastrophic crisis of 1672 (*Het Rampjaar*), when a simultaneous French and English invasion caused the collapse of the republican regime. Stadtholder William III of Orange mobilized royalist mobs, resulting in the lynching of Grand Pensionary Johan de Witt and his brother Cornelis in The Hague, followed by the purge of republican regents across Holland.
- *Structural Defenses*: The decentralization of public finance: the national treasury remained under provincial control, denying the federal center an independent budget and preventing the permanent consolidation of military rule.

Case 4: The United States under the Articles of Confederation

Drafted by the Continental Congress in 1777, ratified in 1781, and discarded in 1789; confederated 13 sovereign states with a population of approximately 3.5 million people.

The Articles created a single-tier confederal structure:

1. *State Legislatures*: Sovereign state assemblies electing delegates annually.
2. *Continental Congress*: A unicameral assembly where each state cast a single vote, exercised by a delegation of two to seven members.

Congress held the authority to declare war, conduct diplomacy, and requisition funds and troops from the states. However, it lacked the power to levy taxes directly on individuals, regulate interstate commerce, or enforce its requisitions through domestic police or military power. Passing significant legislation required nine of thirteen state votes; constitutional amendments, including the establishment of federal tariffs (*imposts*), required unanimous ratification by all thirteen state legislatures. The delegation ratio was 1 state vote per 270,000 citizens.

Tripartite Separation

- *Self-Conception*: A "firm league of friendship" among sovereign republics designed to defend common independence while preventing the rise of a centralized monarchical or parliamentary tyranny.
- *Historical Record*: The confederal architecture suffered systemic collective-action failure. States treated congressional requisitions as voluntary requests; between 1781 and 1786, the federal treasury collected less than 20% of its financial requisitions, leaving the confederacy unable to service its war debts or pay its soldiers. Individual states (such as Rhode Island in 1781 and New York in 1786) single-handedly vetoed national import tariffs. When economic distress provoked agrarian insurrections—most notably Shays' Rebellion in western Massachusetts in 1786—Congress proved incapable of mobilizing troops to secure its own arsenals.
- *Modern Scholarly Consensus*: While Merrill Jensen (1940) defended the Articles as a protective framework for radical agrarian democracy against commercial elites, the modern consensus among institutional historians (Rakove 1996; Wood 1969) confirms that the unanimity rule and lack of direct fiscal authority produced systemic free-riding that made institutional collapse or fragmentation inevitable.

Scale Ledger

- *Household (4–10)*: Worked; family agrarian production.
- *Hamlet (30–50)*: Worked; rural townships.
- *Village (150–500)*: Worked; New England open town meetings.
- *Parish/District (1,500–5,000)*: Worked; county administrative bodies.
- *Watershed/Town (15,000–50,000)*: Worked; state legislative representation.
- *Region (0.5M–5M)*: Failed; multi-state coordination broke down over currency inflation, commercial tariffs, and boundary disputes.
- *Nation/Continent (50M–500M)*: Failed catastrophically; the confederal structure collapsed in less than a decade, replaced by the centralized 1787 federal constitution.
- *Planet (8B)*: Never tried.

Capture Test

- *Vulnerability*: A regional faction or single state exploiting the unanimity requirement to paralyze the confederacy, extracting economic concessions or blocking necessary debt relief.
- *Historical Case*: The capture of the Rhode Island assembly in 1786 by a radical debtor faction (the Country Party), which printed hyper-depreciated paper currency, made it legal tender for private debts, and blocked national fiscal reform, bringing federal governance to a halt.
- *Structural Defenses*: Strict term limits embedded in the Articles (delegates could serve no more than three years in any six-year period) and annual delegate rotation prevented the formation of an entrenched congressional aristocracy.

Case 5: The Holy Roman Empire of the German Nation (Post-1495)

Evolving from the coronation of Charlemagne (800) and Otto I (962), codified by the Imperial Reform (*Reichsreform*) of 1495 and the Peace of Westphalia (1648), enduring until 1806;

encompassed 16 to 29 million people across 687,000 square kilometers[17].

The post-1495 Empire was a legal order spanning four primary tiers[17]:

1. *Imperial Estates (Reichsstände)*: Over 300 sovereign territories (electorates, prince-bishoprics, imperial abbeys, duchies, free imperial cities) and roughly 1,500 direct imperial knights (*Reichsritter*).
2. *Imperial Circles (Reichskreise)*: Ten regional administrative districts established between 1500 and 1512 (e.g., Swabian, Franconian, Bavarian, Lower Rhenish-Westphalian Circles)[17]. The *Kreise* managed regional defense quotas, tax assessments (*Reichsmatrikel*), currency regulation, and highway policing[20].
3. *Imperial Appellate Courts*: The Imperial Chamber Court (*Reichskammergericht*) based in Wetzlar, appointed jointly by the Emperor and the Estates, and the Imperial Aulic Council (*Reichshofrat*) in Vienna under direct imperial supervision[17].
4. *Perpetual Imperial Diet (Immerwährender Reichstag)*: Meeting permanently at Regensburg after 1663, divided into three colleges: the College of Electors (8 to 9 members), the College of Princes (approximately 100 votes), and the College of Imperial Cities (51 cities).

Decisions required concurrent majorities across the colleges. Following the Peace of Westphalia (1648), religious and constitutional questions could not be decided by simple majority; the Diet separated into Catholic (*Corpus Catholicorum*) and Protestant (*Corpus Evangelicorum*) bodies, requiring compromise through negotiated consensus (*itio in partes*).

The population-to-delegate ratio was approximately $1:150,000$, but delegates represented sovereign corporate entities rather than equal numbers of citizens.

Tripartite Separation

- *Self-Conception*: The universal, divinely ordained continuation of the Roman Empire, preserving Christian peace, justice, and corporate rights (*deutsche Libertät*) across Central Europe[17].

- *Historical Record*: Nineteenth-century nationalist historians dismissed the Empire as a fragmented, paralyzed relic ("neither Holy, nor Roman, nor an Empire"). In practice, the imperial legal structure effectively protected minor states, free cities, and peasant communities against aggression by larger German principalities[17]. Peasant communities routinely sued their lords in the *Reichskammergericht*, winning binding injunctions that limited feudal labor dues[17]. However, the Empire lacked a unified standing army, relying on slow mobilization quotas across the *Reichskreise* that left it vulnerable to external invasions[17].
- *Modern Scholarly Consensus*: Peter H. Wilson (1999, 2016) and Joachim Whaley (2012) prove that the Empire was an exceptionally durable legal clearinghouse that preserved the autonomy of small territories and protected corporate liberties for three centuries through judicial arbitration rather than military coercion[17].

Scale Ledger

- *Household (4–10)*: Worked; manorial peasant households.
- *Hamlet (30–50)*: Worked; agricultural communities.
- *Village (150–500)*: Worked; self-governing village communes (*Gemeinden*).
- *Parish/District (1,500–5,000)*: Worked; knightly lordships and ecclesiastical domains.
- *Watershed/Town (15,000–50,000)*: Worked; free imperial cities (Nuremberg, Frankfurt, Augsburg, Ulm).
- *Region (0.5M–5M)*: Worked; the 10 Imperial Circles (*Reichskreise*) successfully coordinated regional governance for 300 years[17].
- *Nation/Continent (50M–500M)*: Worked; governed 16 to 29 million people across Central Europe[19].
- *Planet (8B)*: Never tried.

Capture Test

- *Vulnerability*: A militarized princely dynasty expanding its private territory until it can defy imperial court injunctions and dismantle the imperial balance of power.
- *Historical Case*: The rise of Brandenburg-Prussia under Frederick the Great, who invaded Austrian Silesia in 1740, ignored the verdicts of the Imperial Courts, and neutralized the Diet through military force, creating a paralyzed Austro-Prussian dualism that shattered the Empire's collective security system.
- *Structural Defenses*: Dual competing supreme courts (*Reichskammergericht* and *Reichshofrat*) prevented any single prince from controlling the judicial machinery[17]; smaller states formed defensive leagues (*Kreisassoziationen*) to counterbalance expansionist dynasties.

Case 6: The European Union

Originating with the 1957 Treaty of Rome and codified by the 1992 Maastricht Treaty and 2007 Lisbon Treaty; coordinates 27 member states and 450 million citizens.

The European Union is a hybrid intergovernmental-supranational confederacy spanning four primary administrative tiers:

1. *Regional and Municipal Authorities*: Local communes, districts, and devolved regional parliaments.
2. *Member State Governments*: Sovereign national states.
3. *Council of the European Union and European Council*: Intergovernmental assemblies representing national executives. Decisions require Qualified Majority Voting (QMV: 55% of member states representing 65% of the total EU population) or unanimity (taxation, foreign policy, and treaty changes).
4. *European Commission and European Parliament*: The Commission holds a monopoly on legislative initiatives; the directly elected European Parliament (720 members) exercises co-decision on budgets and directives.

The delegation ratio is compressed: 720 Members of the European Parliament represent 450 million citizens (approximately 1 MEP per 625,000 people). In the Council of the EU, an individual minister casts a weighted vote representing an entire national population (e.g., Germany's representative speaks for 84 million citizens, a ratio of $1:84,000,000$). The system is governed by the Principle of Subsidiarity (Article 5(3) TEU), which mandates that decisions be taken at the lowest feasible administrative level unless EU-level action is demonstrably more effective.

Tripartite Separation

- *Self-Conception*: A democratic, rules-based union of sovereign nations preserving continental peace, human rights, and market integration through law, subsidiarity, and consensual negotiation.
- *Historical Record*: In practice, the principle of subsidiarity is regularly overridden by the supremacy of EU law (*Costa v. ENEL*, 1964). Regulatory decisions are often negotiated within non-transparent committees of national and supranational civil servants (the "Comitology" framework and COREPER), largely insulating decision-making from direct popular accountability and creating an acknowledged "democratic deficit."
- *Modern Scholarly Consensus*: Political scientists (Moravcsik 2002; Scharpf 1999) characterize the EU as a regulatory regime operating through negative market integration, frequently trapped in a "joint-decision trap" where national vetoes and supermajority requirements prevent effective redistributive policies or rapid geopolitical

responses.

Scale Ledger

- *Household (4–10)*: Not directly integrated.
- *Hamlet (30–50)*: Never tried.
- *Village (150–500)*: Never tried.
- *Parish/District (1,500–5,000)*: Never tried directly.
- *Watershed/Town (15,000–50,000)*: Indirectly integrated via national governance.
- *Region (0.5M–5M)*: Consultative only (Committee of the Regions).
- *Nation/Continent (50M–500M)*: Worked; coordinates 450 million people across 27 nation-states.
- *Planet (8B)*: Never tried.

Capture Test

- *Vulnerability*: Technocratic capture by corporate lobby networks and executive bureaucracies, combined with procedural obstruction by illiberal member states exploiting unanimity rules.
- *Historical Case*: The Hungarian government under Viktor Orbán systematically using its national veto on foreign policy resolutions and budget packages to extract financial exemptions and shield its domestic illiberal reforms from EU judicial sanctions.
- *Structural Defenses*: The European Court of Justice (ECJ) exercises binding jurisdiction over national law; the Article 7 procedure allows the suspension of voting rights for member states that breach foundational rule-of-law principles (though Article 7 itself is vulnerable to reciprocal vetoes between allied member states).

Case 7: Democratic Confederalism in Rojava (DAANES / TEV-DEM)

Established in northeastern Syria in 2012 during the Syrian Civil War; theoretically based on Abdullah Öcalan's doctrine of Democratic Confederalism (derived from Murray Bookchin's social ecology); governing approximately 4.5 million people[22].

The Democratic Autonomous Administration of North and East Syria (DAANES) is organized

into a five-tier nested structure[23]:

1. *Commune (Komîn)*: The foundational unit, comprising 30 to 150 households in a village or urban neighborhood[25]. Meets bi-weekly; manages local disputes through Peace and Reconciliation Committees (*Sulh*), distributes basic rations (flour, diesel), and coordinates civilian defense[25].
2. *Community Council (Meclîs)*: Gathers 7 to 30 communes in an urban quarter or rural sub-district.
3. *District Council (Navçe)*: Coordinates municipal public works, hospitals, and educational facilities[24].
4. *Canton Council*: Regional coordinating bodies (historically Jazira, Kobane, Afrin) managing regional resources and justice systems[23].
5. *Democratic Council of People of North and East Syria / Syrian Democratic Council (SDC)*: The apex confederal legislative assembly[25].

The system enforces a co-chair model (*Hevserokti*): every council, committee, and administrative body must have one male and one female co-chair, backed by a mandatory 50% gender quota across all positions[24]. Delegates are bound by imperative mandates and subject to recall by their base communes. The primary delegation ratio is roughly 1 delegate per 50 to 100 households.

Tripartite Separation

- *Self-Conception*: A stateless, direct-democratic, feminist, and ecological society that dismantles state coercion in favor of horizontal communal self-determination and multi-ethnic coexistence[24].
- *Historical Record*: The civilian council structure operates alongside a centralized military and security hierarchy[26]. Ultimate authority over security, foreign relations, and strategic resources (such as the Rmelan oil fields) rests with the leadership of the Syrian Democratic Forces (SDF/YPG) and experienced political cadres (*kadro*) affiliated with the PKK[22]. In Arab-majority districts such as Raqqa and Deir ez-Zor, local tribal populations have protested against military conscription and political control by Kurdish-led cadres.
- *Modern Scholarly Consensus*: Field researchers (Schmidinger 2018; Knapp et al. 2016) evaluate Rojava as an institutional hybrid: it maintains authentic direct democracy at the local commune level while relying on a centralized military vanguard to ensure defense and security in an active war zone[22].

Scale Ledger

- *Household (4–10)*: Worked; organized via residential units.
- *Hamlet (30–50)*: Worked; rural commune units[23].
- *Village (150–500)*: Worked; standard village commune[25].
- *Parish/District (1,500–5,000)*: Worked; district-level coordination[25].
- *Watershed/Town (15,000–50,000)*: Worked; municipal councils[25].
- *Region (0.5M–5M)*: Worked; cantonal administrations coordinate 4.5 million people[23].
- *Nation/Continent (50M–500M)*: Never tried.
- *Planet (8B)*: Never tried.

Capture Test

- *Vulnerability*: A political-military vanguard monopolizing energy supplies, internal security apparatuses (Asayîş), and military command to bypass elected civilian councils[27].
- *Historical Case*: The marginalization, closure of offices, and periodic detention of members of the opposition Kurdish National Council (KNC) by internal security forces between 2014 and 2017, which effectively prevented political pluralism in regional assemblies[27].
- *Structural Defenses*: Mandatory gender co-chairing and the autonomous institutional power of the Women's Defense Units (Kongra Star), which holds independent veto power over any council decisions regarding family law, marriage, and gender-based violence[24].

Case 8: The Zapatista Rebel Autonomous Systems (Chiapas, Mexico)

Originating with the January 1, 1994 armed uprising of the Zapatista Army of National Liberation (EZLN); governing between 250,000 and 360,000 indigenous Maya people in the highlands and Lacandon jungle of Chiapas[29].

From 2003 to 2023, Zapatista autonomous governance operated across four nested tiers[29]:

1. *Base Communities*: Direct face-to-face assemblies in indigenous hamlets.
2. *MAREZ (Rebel Zapatista Autonomous Municipalities)*: Groupings of multiple base communities coordinating local education, agro-ecology, and justice[29].
3. *Juntas de Buen Gobierno (Good Governance Councils)*: Situated in 12 to 16 regional cultural centers (*Caracoles*)[29].
4. *CCRI-CG (Clandestine Revolutionary Indigenous Committee)*: The military command of the EZLN, which was explicitly barred by its own charters from holding civilian political office or directing community assemblies[29].

The *Juntas de Buen Gobierno* were staffed by rotating delegations of ordinary community members selected by sortition (*rotación obligatoria*). Delegates served short, unpaid terms lasting from two weeks to one month. Governed by the philosophical mandate of *Mandar Obedeciendo* ("To Command by Obeying"), delegates held no permanent executive authority, were revocable at any moment, and had to submit all major policy shifts to local assemblies for

community ratification.

The November 2023 Restructuring

In November 2023, Subcomandante Insurgente Moisés issued a communique announcing the formal dissolution of both the MAREZ and the *Juntas de Buen Gobierno*[29]. The intermediate tiers were eliminated due to expanding violence from transnational drug cartels (the Sinaloa Cartel and the Jalisco New Generation Cartel) and administrative fatigue[29]. Autonomy was reorganized downward:

- *GAL (Local Autonomous Governments)*: Highly decentralized, base-level community bodies[29].
- *CGAZ (Collectives of Autonomous Zapatista Governments)*: Flexible inter-community assemblies convened only when external coordination is strictly necessary[29].

Tripartite Separation

- *Self-Conception*: An autonomous, anti-capitalist Mayan indigenous movement governed by seven core precepts (including "to serve, not serve oneself" and "to construct, not destroy"), free from the Mexican state.
- *Historical Record*: The civilian councils depended heavily on the armed deterrent of the EZLN to protect territory, repel military encirclement, and maintain internal order[29]. Furthermore, rotating regular community members through regional administrative roles every two to four weeks generated chronic institutional amnesia: newly installed delegates struggled to manage regional clinics, solar electrical grids, and multi-lingual legal disputes.
- *Modern Scholarly Consensus*: Anthropologists (Speed 2008; Nash 2001) demonstrate that while rotational sortition successfully prevented political corruption and class stratification, it proved structurally fragile under sustained logistical strain, economic isolation, and armed criminal cartel violence, forcing the retreat to hyper-localized community cells[29].

Scale Ledger

- *Household (4–10)*: Worked; indigenous Mayan peasant households.
- *Hamlet (30–50)*: Worked; primary base communities.
- *Village (150–500)*: Worked; local community assemblies.
- *Parish/District (1,500–5,000)*: Worked (the MAREZ level from 1994 to 2023)[29].
- *Watershed/Town (15,000–50,000)*: Worked (the Caracoles and Juntas from 2003 to 2023)[29].
- *Region (0.5M–5M)*: Failed/Unattempted; regional coordination collapsed under cartel pressure in 2023[29].
- *Nation/Continent (50M–500M)*: Never tried.
- *Planet (8B)*: Never tried.

Capture Test

- *Vulnerability*: Criminal cartels infiltrating transit corridors to extort communities, or military command structures using security crises to marginalize civilian assemblies[29].
- *Historical Case*: The expansion of cartel violence in Chiapas between 2021 and 2023,

where armed syndicates took control of highway networks and municipal towns, severing communication between the *Caracoles* and forcing the EZLN to dissolve the regional *Juntas*[29].

- *Structural Defenses*: Short-term rotational sortition (*cargos*) prevented delegates from accumulating personal power or establishing lucrative patronage relationships with external political parties.

5. Cross-Case Synthesis and the Historical Design Envelope

Comparing these eight systems across institutional mechanics, durations, and scales reveals the structural patterns that govern nested governance.

Polity / System	Historical Lifespan	Vertical Layers (LLL)	Base Unit	Primary Delegation Ratio (rrr)	Population Span	Decisive Decision Rule	Primary Failure Mode
Haudenosaunee	c. 1142/1450–Pres.	4	Longhouse Hearth	$1:$ [cite: 13]	1.5×10	Unanimity by Moiety Cross-talk	War chief bypass; proxy division in 1777.
Old Swiss Confed.	1291–1798 (507 yrs)	3	Rural Commune / Urban Guild	$1:$	$1.5 \times$	Unit Vote / Unanimity (*Tagsatzung*)	Urban-patrician exploitation; French invasion.
Dutch Republic	1579–1795 (216 yrs)	3	Municipal *Vroedschap*	$1:$	$1.8 \times$	Unanimity (*last en rugges praak*)[16]	Fiscal deadlock; military paralysis during

							crises.
Articles of Confed.	1781–1789 (8 yrs)	2	Sovereign State Legislature	$1:$	$3.5\times$	Supermajority (9/13) / Unanimity	Structural free-riding; zero fiscal enforcement.
Holy Roman Empire	1495–1806 (311 yrs)	4	Territorial Estate / Free City[17]	$1:$ [cite: 17]	1.6×10 [cite: 19]	Multi-College Majority / *Itio in partes*	Austro-Prussian dualism; Napoleonic conquest.
European Union	1957/1993–Pres.	4	Member State Government	$1:$	$4.5\times$	Qualified Majority / Unanimity	Technocratic opacity; illiberal member vetoes.
Rojava (DAANES)	2012–Pres. (14+ yrs)	5	Household Commune[23]	$1:$	$4.5\times$ [cite: 25]	Consensus / Subsidiarity Quotas[25]	Military vanguard dominance; external encirclement[27].
Zapatistas (MARE	1994–2023 (29 yrs)	4	Indigenous Hamlet	Rotational Sortition[29]	$3.0\times$ [cite: 30]	Consensus (*Mandar*	Rotational burnout; cartel

Z)						*Obedeciendo*)	violence (dissolved 2023)[29].

The Historical Design Envelope

Analyzing the points where these systems succeeded versus where they broke down establishes the **Historical Design Envelope**—the structural boundaries within which non-coercive nested governance has historically functioned:

1. The Vertical Layer Boundary ($L \leq 4 \text{ to } 5$)

No nested confederacy in recorded history has preserved direct constituent accountability beyond four or five vertical tiers. When a system expands to six or more tiers, the compound loss of control identified by Tullock and Downs reduces the base signal below functional coherence[1]. At that depth, intermediate delegates inevitably consolidate into an autonomous administrative class, and upper councils operate insulated from base assemblies regardless of formal democratic rules.

2. The Horizontal Delegation Ratio Boundaries ($1 : 15 \leq r \leq 1 : 150$)

Historical systems that maintained stability without establishing standing police forces operated within a specific delegation ratio band:

- *The Lower Floor ($r \geq 15$)*: If the delegation ratio drops below $1 : 15$, the number of vertical tiers multiplies rapidly, producing severe administrative latency and compounding signal distortion[1].
- *The Upper Ceiling ($r \leq 150$)*: If the ratio exceeds $1 : 150$, direct social monitoring collapses. Once an individual delegate represents more than 150 households or primary units, selection shifts from personal evaluation to charismatic performance, programmatic ideology, factional mobilization, or commercial patronage.

3. The Unanimity Trap

Systems that require unanimous consent across all constituent units (the Haudenosaunee Grand Council, the Dutch States-General, the Articles of Confederation, and the Holy Roman Empire on religious matters) survive only during periods of low external threat or deep cultural homogeneity[13].

Under acute military, fiscal, or epidemiological crisis, the unanimity rule creates severe institutional paralysis. It grants single units or minority factions an absolute veto, which they routinely weaponize to extract private rents, block mutual defense contributions, or advance foreign interests.

4. The Executive Command Dilemma

Stateless nested councils struggle to manage high-tempo defensive warfare. In every historical case examined, multi-tier confederacies survived external military violence only by generating an asymmetric executive command structure: the Roman dictatorship, the Dutch

Stadtholderate, the American presidency of 1787, the Swiss wartime generalship, the EZLN military high command, or the YPG/SDF leadership behind Rojava's civil administration[25]. When external security threats become permanent, these military commands tend to subordinate the civilian council apparatus, turning bottom-up confederalism into a legitimizing facade for vanguard rule[22].

6. The Strongest Case Against Nested Council Governance

The critique of nested council systems (historically known as the soviet model, the *Rätesystem*, or confederal communalism) is grounded in organizational sociology, public choice theory, and political economy.

Leading Critics and Theoretical Foundations

1. Robert Michels (1911) – *Political Parties: A Sociological Study of the Oligarchical Tendencies of Modern Democracy*

Michels formulated the **Iron Law of Oligarchy**: *"Who says organization, says oligarchy."* Regardless of a movement's initial commitment to horizontal direct democracy, the practical requirements of coordinating activity across distance require technical specialization. Full-time delegates, committee chairs, and recording secretaries inevitably acquire specialized knowledge, procedural experience, and professional relationships denied to ordinary citizens tied to daily agricultural labor. Over time, delegates develop distinct corporate interests focused on institutional preservation, systematically insulating themselves from lower-tier recall.

2. Gordon Tullock (1965) and James M. Buchanan (1962) – *The Politics of Bureaucracy* & *The Calculus of Consent*

Tullock and Buchanan demonstrated that indirect delegation chains maximize information asymmetry and agency slack[2]. In an indirect multi-tier council, the individual voter at the base has zero influence over the selection of apex delegates. Buchanan and Tullock proved that while multi-tier systems appear to reduce voting transaction costs for the base, they exponentially inflate agency costs at the top[31]. Intermediate delegates engage in log-rolling, reciprocal favor trading, and backroom bargaining that are completely hidden from the view of base assemblies[5].

3. Mancur Olson (1965) – *The Logic of Collective Action*

Olson proved that large, distributed groups face overwhelming structural incentives to free-ride, whereas small, concentrated interest groups organize efficiently. In a nested ladder, each higher tier represents a larger geographic territory and population. Monitoring delegates at Tier 3 or 4 represents an enormous personal investment of time and energy for an ordinary farming household, yielding negligible individual returns. Conversely, organized factions, regional trade cartels, and charismatic cliques have concentrated incentives to capture upper-tier assemblies.

4. William H. Riker (1964) – *Federalism: Origin, Operation, Significance*

Riker examined the political economics of confederations and concluded that pure

confederacies—where the central body coordinates constituent sovereign units rather than exercising direct legal authority over individual citizens—are inherently unstable. They systematically follow one of two paths: they either dissolve through regional secession and conflict (as occurred in the American Confederation, the Dutch Republic, and the Swiss *Sonderbund* of 1847), or they centralize into a coercive federal state equipped with a unified tax apparatus and standing army.

Structural Pathologies of Multi-Tier Horizontality

The critique identifies five recurring operational failures in multi-tier horizontal systems:

Extreme Decision Latency (The Snail Commonwealth)

The institutional requirement of imperative consultation (*last en ruggespraak*) paralyzes decision-making during crises[16]. When a flood damages regional infrastructure, an epidemic spreads across a watershed, or an armed raiding party invades, decisions must be made in hours or days. A system that requires delegates to return to their base villages for multi-week deliberative consultations will be overwhelmed by external crises[1].

Opaque Filtering and Ideological Polarization

At the base level, primary assemblies reward ideological commitment, vocal confidence, and purity of principle. By the time delegates reach Tier 3 or Tier 4, however, practical compromises require pragmatic deal-making. This dynamic breeds institutional hypocrisy: delegates maintain radical, unbending rhetoric when addressing their base communities, while quietly negotiating compromises behind closed doors at upper councils to keep the system functioning.

Local Tyranny and the Parochial Veto

Decentralization does not ensure benevolence. Absent an overarching legal authority that enforces individual rights across territories, local village councils frequently institutionalize patriarchal violence, clan feuds, xenophobia, and the subjugation of minority lineages. Small-scale face-to-face communities can operate as suffocating moral panopticons, using ostracism, religious persecution, and physical coercion against dissenting individuals.

Geographic Inequality and Resource Hoarding

Natural resources are distributed unevenly across geography. Some districts contain fertile river valleys, salt deposits, iron mines, and functioning mills; others consist of arid hillsides and depleted timberlands. In a nested confederacy that lacks a centralized tax apparatus, resource-rich councils naturally hoard their windfalls, refusing to share surpluses with poorer neighboring districts. This hoarding inevitably triggers inter-district trade wars, boundary disputes, and resource raiding.

Executive Coups during Military Emergencies

Because deliberative councils are poorly structured for unified military command, sustained external conflict creates intense pressure to bypass the council apparatus. Populations facing military destruction look outside the assembly for security, turning to charismatic military figures. These commanders exploit emergencies to seize executive power, reducing the council system to a symbolic rubber stamp[22].

7. Summary of Robust Findings

1. Scaling self-governance without centralized coercion requires nested delegation, trading

vertical layer depth against the horizontal delegation ratio.

2. Delegation ratios below $1:15$ inflate vertical depth ($L \geq 8$), producing severe transmission latency and compounding information loss[1].
3. Delegation ratios exceeding $1:150$ break Dunbar's cognitive limit, replacing personal reputational monitoring with charismatic performance, ideology, and factional machines.
4. Information fidelity and agent alignment decay exponentially across vertical tiers ($I_L = I_0 \cdot f^L$), rendering systems deeper than four tiers largely unaccountable to their base[1].
5. Physical communication logistics impose hard spatial boundaries: pedestrian confederacies cannot govern beyond a watershed (~85 km radius) without catastrophic coordination lag[1].
6. Equine relay systems expand the viable administrative boundary to the regional level (~335 km radius), but continental governance on horseback remains marginal[1].
7. Low-power HF radio decouples information speed from transit, dropping continental latency to weeks, but cannot replace the physical travel of delegates[1].
8. Historically durable confederacies (Haudenosaunee, Swiss, Dutch, HRE) operated within a tight design envelope of 3 to 4 vertical tiers and ratios under $1:150$ at the base[13].
9. Mandatory unanimity rules routinely cause legislative paralysis during emergencies, inviting foreign corruption, institutional bypass, or civil conflict.
10. Rotational sortition successfully prevents the formation of permanent political elites, but induces chronic administrative amnesia and vulnerability to organized external predators[29].

8. Contested or Open Questions

- *Can asynchronous cryptographic communication replace physical assemblies without degrading trust?* Does physical co-presence remain an irreplaceable biological requirement for evaluating deceptive intent, Machiavellian maneuvering, and genuine consensus?
- *What is the precise demographic threshold where informal reputational monitoring fails to suppress Dark Triad behaviors?* While Dunbar's limit identifies a general cognitive boundary at 150 individuals, does an off-grid survival environment accelerate or suppress sociopathic manipulation in groups of 30 to 100?
- *Is the imperative mandate compatible with regional survival?* If delegates are strictly bound to local instructions and cannot adapt to evolving negotiations, can multi-watershed crises ever be resolved without violating constituent instructions?
- *Can a nested confederal system enforce regional resource sharing without a standing army?* If an upstream village dams a river or hoards salt and medical reserves, can an unarmed upper council enforce redistribution against local resistance?
- *Does rotational sortition inevitably cause administrative breakdown in complex technical environments?* Did the 2023 dissolution of the Zapatista regional *Juntas* stem

fundamentally from institutional fatigue and administrative amnesia, or was it primarily driven by armed drug cartel violence[29]?

- **Innis, Harold A. (1950). *Empire and Communications*. Oxford: Clarendon Press.** The foundational text establishing how the physical properties of media (time-bias vs. space-bias) dictate the administrative scale, institutional centralization, and geographic reach of human governance[6].
- **Tullock, Gordon (1965). *The Politics of Bureaucracy*. Washington, DC: Public Affairs Press.** The definitive public-choice analysis of "loss of control" in administrative hierarchies, modeling how information is filtered, condensed, and distorted across multi-tier delegation chains[2].
- **Fenton, William N. (1998). *The Great Law and the Longhouse: A Political History of the Iroquois Confederacy*. Norman: University of Oklahoma Press.** The authoritative ethnohistorical study of the Haudenosaunee constitutional order, documenting the operation of the 50 sachems, Clan Mother vetoes, and condolence diplomacy[13].
- **Wilson, Peter H. (2016). *Heart of Europe: A History of the Holy Roman Empire*. Cambridge, MA: Harvard University Press.** A comprehensive modern reassessment of the Empire's polycentric legal system, demonstrating how regional *Reichskreise* and imperial courts protected small-state autonomy and corporate rights for centuries[17].
- **Israel, Jonathan I. (1995). *The Dutch Republic: Its Rise, Greatness, and Fall 1477–1806*. Oxford: Clarendon Press.** The definitive structural history of the United Provinces, detailing the mechanics of *last en ruggespraak*, urban regent cartels, and the structural tensions between the States-General and the Stadtholderate[16].
- **Michels, Robert (1911). *Political Parties: A Sociological Study of the Oligarchical Tendencies of Modern Democracy*. Leipzig: Werner Klinkhardt.**
  The classic sociological formulation of the Iron Law of Oligarchy, demonstrating why horizontal and democratic organizations generate entrenched, self-serving administrative elites.
- **Knapp, Michael, Flach, Anja, and Ayboga, Ercan (2016). *Revolution in Rojava: Democratic Autonomy and Women's Liberation in Syrian Kurdistan*. London: Pluto Press.** The primary field study of Rojava's five-tier council system, detailing the practical operation of neighborhood communes, co-chair mandates, and gender quotas[24].
- **Riker, William H. (1964). *Federalism: Origin, Operation, Significance*. Boston: Little, Brown and Company.**
  The foundational public-choice treatise demonstrating the structural instability of pure confederations and analyzing the fiscal and military imperatives of federal unions.

10. Implementability after the Fall

Rebuilding nested governance following the permanent collapse of industrial supply chains, electrical grids, and state power requires establishing a **Minimum Viable Governance System (MVGS)**. The institutional architecture must assemble from the bottom up, matching administrative complexity to physical communication limits.

Minimum Viable Implementation across Three Tiers

Tier 1: The Household (4 to 10 People)

- **Institutional Structure**: The basic domestic unit of production and survival. All adult and adolescent members assemble daily at morning and evening meals. Decisions on labor division, caloric rationing, and immediate security are made by consensus, guided by senior male and female hearth managers.
- **Required Material Artifacts**:
  - *Shared Calendar*: A solar and lunar calendar carved into timber or marked on durable paper, tracking planting schedules, frost windows, livestock gestation, and rationing reserves.
  - *Records*: A physical household ledger (rag paper, carbon or iron gall ink) recording livestock lineages, seed stores, grain inventories, tool allocations, debts, and clinical entries (births, deaths, illnesses).
  - *Meeting Place*: The domestic hearth or central kitchen table.
  - *Literacy*: A minimum of one literate and numerate individual capable of keeping ledgers, measuring land boundaries, and reading regional advisories.
- **First Failure to Expect**: *Domestic autocracy and patriarchal exploitation*. Under survival conditions, the physical strength advantage of mature males frequently reasserts patriarchal domination, turning the household into an autocracy unless external community norms intervene.

Tier 2: The Village (300 People / ~60 Households)

- **Institutional Structure**: The foundational face-to-face deliberative commune. Governed by a **Village Assembly of Stewards** meeting weekly.
  - *Delegation Ratio*: $1:5$ to $1:10$. Each household sends 1 to 2 designated stewards (one male and one female where feasible) to the assembly, forming a deliberative body of 60 to 120 people, matching the Athenian *prytaneis* or Swiss *Landsgemeinde*.
  - *Executive Council*: A working committee of 5 to 7 individuals selected by **annual sortition** (lottery) from all eligible households, subject to immediate recall and barred from consecutive terms. The committee manages common defense, pasture rotation, irrigation water distribution, and grain milling.
- **Required Material Artifacts**:
  - *Meeting Place*: A covered, unheated Common Hall or central village barn capable of sheltering 150 adults within unamplified acoustic range.
  - *Shared Calendar*: A public sundial and a heavy civic bell or forged steel rail for acoustic signaling (calling assemblies, sounding fire and raid alarms).
  - *Records*: The Village Parish Roll—a heavy bound book containing land boundaries, water schedules, marriage records, and criminal restitution decisions, stored in a locked timber chest requiring two separate keys held by unrelated stewards.
  - *Literacy*: At least 10% to 15% functional literacy across households to prevent a scribal elite from monopolizing legal and financial interpretation.
- **First Failure to Expect**: *Factional feud between dominant clan networks*. Two or three extended families will form voting cartels, attempting to monopolize prime agricultural

land, control communal water access, and shield their relatives from criminal restitution.

Tier 3: The District (3,000 People / 10 Villages / ~600 Households)

- **Institutional Structure**: The regional watershed coordination council. Governed by the **District Board of Wardens**.
  - *Delegation Mechanics*: Each of the 10 constituent villages sends exactly 3 delegates chosen by their village assembly (1 selected by sortition, 1 senior agricultural steward, 1 defensive militia warden), forming a working council of 30 wardens.
  - *Delegation Ratio*: $1:100$ (delegates to individuals) or $1:20$ (delegates to households).
  - *Mandate Structure*: Strict imperative mandates (*last en ruggespraak*) on fundamental resource decisions: river diversions, emergency grain requisitions, quarantine declarations, and capital legal appeals[16]. Routine administrative coordination (road clearing, market dispute arbitration, perimeter patrolling) proceeds by simple majority.
- **Required Material Artifacts**:
  - *Meeting Place*: A fortified, centrally located market town or defensible church/mill compound, situated within a 15 to 20 km radius (a 3-to-4 hour walk or 1-to-2 hour horse ride) of all 10 villages.
  - *Communications Network*: A maintained relay stable of 4 to 6 horses and trained pedestrian runners capable of traversing the district perimeter within 6 hours. If available, one low-power, solar-charged HF radio transceiver with a trained operator, running scheduled weekly communication checks with neighboring districts.
  - *Records*: The District Registry containing surveyed drainage maps, watershed agreements, standardized weights and measures, and inter-village debt ledgers.
  - *Literacy*: Professional scribal and legal literacy (surveyors, mechanics, legal arbiters) capable of maintaining uniform standards across autonomous village units.
- **First Failure to Expect**: *Geographic hoarding and upstream resource secession.* The village located at the headwaters of the district's primary river or controlling local salt or iron deposits will assert private ownership over those resources, refusing to submit to District Board allocation quotas and threatening downstream communities with ecological sabotage.

11. Principles

- **Principle of Layer-Signal Attenuation**: Every additional vertical tier in a nested governance ladder reduces cumulative policy signal fidelity by ten to twenty percent, making systems deeper than four tiers structurally unaccountable to their base[1].
- **Principle of Cognitive Horizon Bounding**: A delegation ratio exceeding one representative per one hundred and fifty individuals shifts selection from direct reputational monitoring to charismatic performance, programmatic ideology, and factional patronage.
- **Principle of Media-Paced Geographic Reach**: The maximum viable administrative radius of a non-authoritarian nested confederation is strictly bounded by the distance a courier can travel and return within one-quarter of a seasonal agricultural cycle[1].

- **Principle of Structural Anti-Vanguard Rotation**: Systems that rotate delegates through mandatory sortition prevent the formation of permanent managerial elites, but suffer chronic institutional amnesia and technical vulnerability to organized external rivals[29].
- **Principle of the Unanimity Impasse**: Enforcing unanimous consensus across sovereign constituent units guarantees minority obstruction, fiscal failure, and institutional collapse during high-tempo survival crises.
- **Principle of Coercive Asymmetry in Military Crisis**: Decentralized confederal councils that fail to establish a unified, specialized executive command structure during sustained warfare are routinely subjugated by centralized imperial or criminal adversaries[25].
- **Principle of Distributed Negative Veto**: Institutional capture by predatory Dark Triad actors is effectively prevented only when negative veto power over executive action is permanently vested in an autonomous, structurally separate body, such as maternal lineage elders or sortition-selected civilian juries[14].
- **Principle of Local Autonomy Over Administrative Extension**: A confederation survives across deep time only when higher councils are legally restricted to resolving negative externalities between lower units, leaving daily administrative authority entirely within face-to-face primary communes.
